# Motivation

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 9 —

© P. Cousot & R. Cousot 

## Motivation

- We look for a formalism to specify abstract program semantics
  - from definitional semantics ...
  - to static program analysis algorithms
- coping with termination & non-termination,
- handling the many different styles of presentations found in the literature (rules, fixpoint, equations, constraints, ...) in a uniform way
- A simple generalization of inductive definitions from sets to posets seems adequate.

## On the importance of defining both finite and infinite behaviors

- Example of the *choice operator*  $E_1 \mid E_2$  where:

$E_1 \Rightarrow a$     $E_2 \Rightarrow b$    termination  
 or    $E_1 \Rightarrow \perp$     $E_2 \Rightarrow \perp$    non-termination

- The *finite behavior* of  $E_1 \mid E_2$  is:

$$a \mid b \Rightarrow a \quad a \mid b \Rightarrow b \quad .$$

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 11 —

© P. Cousot & R. Cousot

- But for the case  $\perp \mid \perp \Rightarrow \perp$ , the *infinite behaviors* of  $E_1 \mid E_2$  depend on the choice method:

Non-deterministic	Parallel	Eager	Mixed left-to-right	Mixed right-to-left
$\perp \mid b \Rightarrow b$	$\perp \mid b \Rightarrow b$			$\perp \mid b \Rightarrow b$
$\perp \mid b \Rightarrow \perp$		$\perp \mid b \Rightarrow \perp$	$\perp \mid b \Rightarrow \perp$	$\perp \mid b \Rightarrow \perp$
$a \mid \perp \Rightarrow a$	$a \mid \perp \Rightarrow a$		$a \mid \perp \Rightarrow a$	
$a \mid \perp \Rightarrow \perp$		$a \mid \perp \Rightarrow \perp$	$a \mid \perp \Rightarrow \perp$	$a \mid \perp \Rightarrow \perp$

- Nondeterministic: an internal choice is made initially to evaluate  $E_1$  or to evaluate  $E_2$ ;
- Parallel: evaluate  $E_1$  and  $E_2$  concurrently, with an unspecified scheduling, and return the first available result  $a$  or  $b$ ;
- Mixed left-to-right: evaluate  $E_1$  and then either return its result  $a$  or evaluate  $E_2$  and return its result  $b$ ;
- Mixed right-to-left: evaluate  $E_2$  and then either return its result  $b$  or evaluate  $E_1$  and return its result  $a$ ;
- Eager: evaluate both  $E_1$  and  $E_2$  and return either results if both terminate.

## Semantics of the Eager $\lambda$ -calculus

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 16 —

© P. Cousot & R. Cousot

# Syntax

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 17 —

© P. Cousot & R. Cousot

## Syntax of the Eager $\lambda$ -calculus

$x, y, z, \dots \in \mathbb{X}$	variables
$c \in \mathbb{C}$	constants ( $\mathbb{X} \cap \mathbb{C} = \emptyset$ )
$c ::= 0 \mid 1 \mid \dots$	
$v \in \mathbb{V}$	values
$v ::= c \mid \lambda x \cdot a$	
$e \in \mathbb{E}$	errors
$e ::= c a \mid e a$	
$a, a', a_1, \dots, b, \dots \in \mathbb{T}$	terms
$a ::= x \mid v \mid a a'$	

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 18 —

© P. Cousot & R. Cousot

# Trace Semantics

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 19 —

© P. Cousot & R. Cousot

## Example I: Finite Computation

function	argument
$((\lambda x \cdot x \ x) \ (\lambda y \cdot y))$	$((\lambda z \cdot z) \ 0)$
→	evaluate function
$((\lambda y \cdot y) \ (\lambda y \cdot y))$	$((\lambda z \cdot z) \ 0)$
→	evaluate function, cont'd
$(\lambda y \cdot y) \ ((\lambda z \cdot z) \ 0)$	
→	evaluate argument
$(\lambda y \cdot y) \ 0$	
→	apply function to argument
0	a value!

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 20 —

© P. Cousot & R. Cousot

## Example II: Infinite Computation

function argument  
 $(\lambda x \cdot x x) (\lambda x \cdot x x)$   
→ apply function to argument  
 $(\lambda x \cdot x x) (\lambda x \cdot x x)$   
→ apply function to argument  
 $(\lambda x \cdot x x) (\lambda x \cdot x x)$   
→ apply function to argument  
... *non termination!*

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 21 —

© P. Cousot & R. Cousot

## Example III: Erroneous Computation

function argument  
 $((\lambda x \cdot x x) ((\lambda z \cdot z) 0)) ((\lambda y \cdot y) 0)$   
→ evaluate argument  
 $((\lambda x \cdot x x) ((\lambda z \cdot z) 0)) 0$   
→ evaluate function  
 $((\lambda x \cdot x x) 0) 0$   
→ evaluate function, cont'd  
 $(0 0) 0$

*a runtime error!*

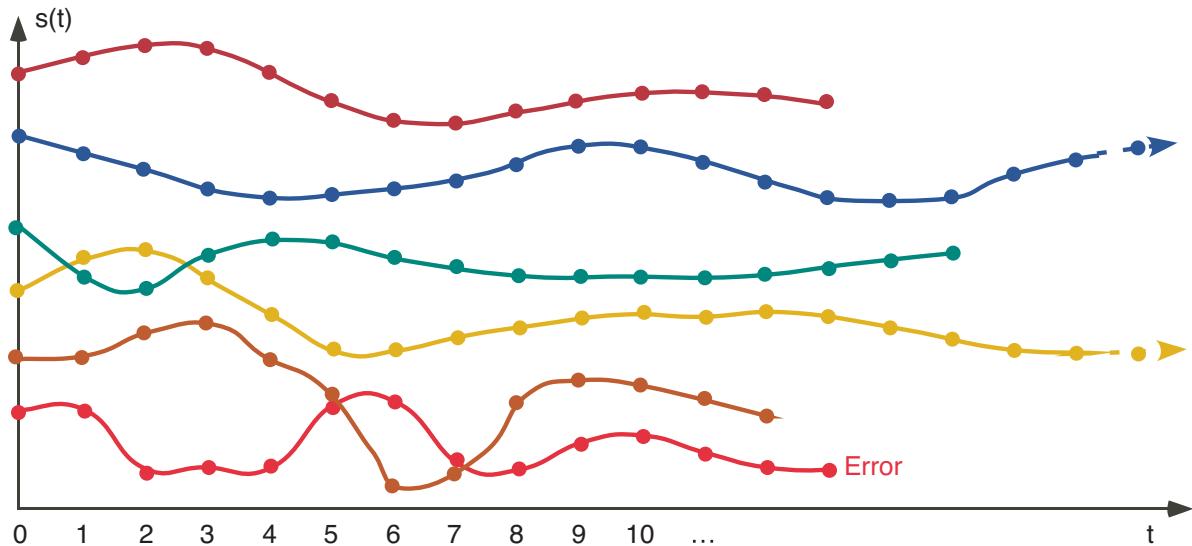

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 22 —

© P. Cousot & R. Cousot

## Finite, Infinite and Erroneous Trace Semantics

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 23 —

© P. Cousot & R. Cousot

## Traces

- $\mathbb{T}^*$  (resp.  $\mathbb{T}^+$ ,  $\mathbb{T}^\omega$ ,  $\mathbb{T}^\alpha$  and  $\mathbb{T}^\infty$ ) be the set of finite (resp. nonempty finite, infinite, finite or infinite, and nonempty finite or infinite) sequences of terms
- $\epsilon$  is the empty sequence  $\epsilon \bullet \sigma = \sigma \bullet \epsilon = \sigma$ .
- $|\sigma| \in \mathbb{N} \cup \{\omega\}$  is the length of  $\sigma \in \mathbb{T}^\alpha$ .  $|\epsilon| = 0$ .
- If  $\sigma \in \mathbb{T}^+$  then  $|\sigma| > 0$  and  $\sigma = \sigma_0 \bullet \sigma_1 \bullet \dots \bullet \sigma_{|\sigma|-1}$ .
- If  $\sigma \in \mathbb{T}^\omega$  then  $|\sigma| = \omega$  and  $\sigma = \sigma_0 \bullet \dots \bullet \sigma_n \bullet \dots$

Tribute to Neil, København, August 25<sup>th</sup>, 2007

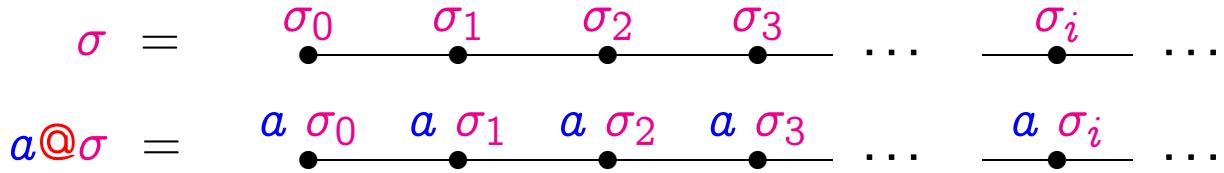

— 24 —

© P. Cousot & R. Cousot

## Operations on Traces

- For  $a \in \mathbb{T}$  and  $\sigma \in \mathbb{T}^\infty$ , we define  $a @ \sigma$  to be  $\sigma' \in \mathbb{T}^\infty$  such that  $\forall i < |\sigma| : \sigma'_i = a \ \sigma_i$

Tribute to Neil, København, August 25<sup>th</sup>, 2007

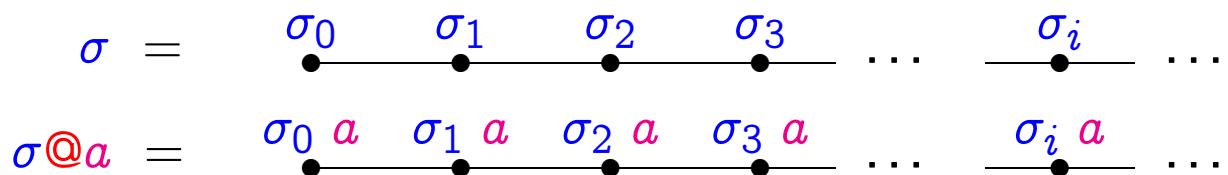

— 25 —

© P. Cousot & R. Cousot

## Operations on Traces (Cont'd)

- Similarly for  $a \in \mathbb{T}$  and  $\sigma \in \mathbb{T}^\infty$ ,  $\sigma @ a$  is  $\sigma'$  where  $\forall i < |\sigma| : \sigma'_i = \sigma_i \ a$

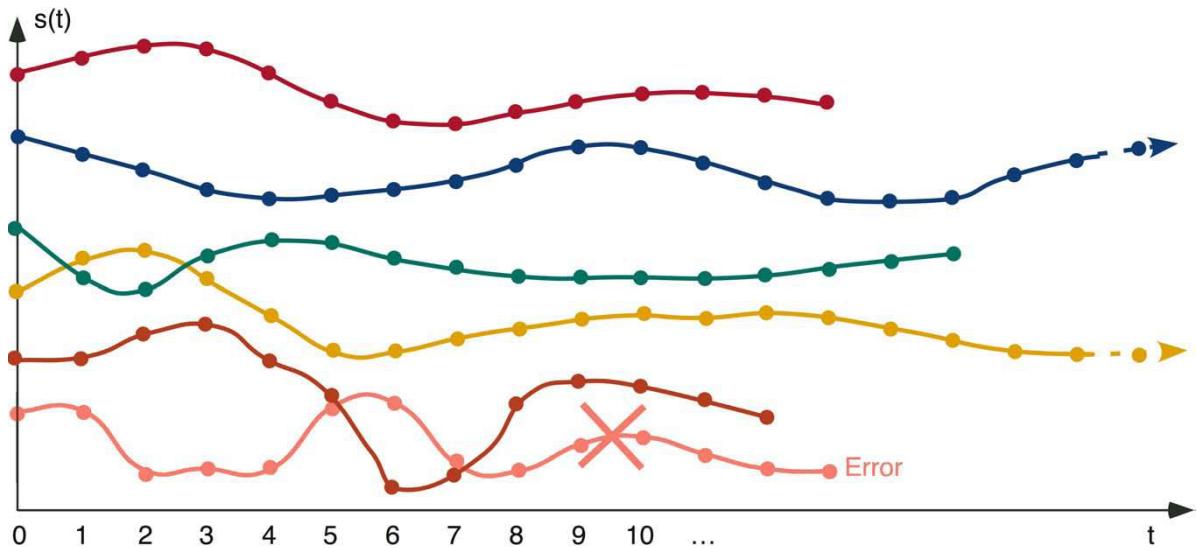

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 26 —

© P. Cousot & R. Cousot

## Finite and Infinite Trace Semantics $\vec{\mathbb{S}}$

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 27 —

© P. Cousot & R. Cousot

## The Computational Lattice

Given  $S, T \in \wp(\mathbb{T}^\infty)$ , we define

- $S^+ \triangleq S \cap \mathbb{T}^+$  finite traces
- $S^\omega \triangleq S \cap \mathbb{T}^\omega$  infinite traces
- $S \sqsubseteq T \triangleq S^+ \subseteq T^+ \wedge S^\omega \supseteq T^\omega$  computational order
- $\langle \wp(\mathbb{T}^\infty), \sqsubseteq, \mathbb{T}^\omega, \mathbb{T}^+, \sqcup, \sqcap \rangle$  is a complete lattice

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 28 —

© P. Cousot & R. Cousot

# Bifinitary Trace Semantics $\vec{\mathbb{S}}$ of the Eager $\lambda$ -calculus<sup>1</sup>

$$v \in \vec{\mathbb{S}}, v \in \mathbb{V}$$

$$\frac{a[x \leftarrow v] \bullet \sigma \in \vec{\mathbb{S}}}{(\lambda x \cdot a) v \bullet a[x \leftarrow v] \bullet \sigma \in \vec{\mathbb{S}}} \sqsubseteq, v \in \mathbb{V}$$

$$\frac{\sigma \in \vec{\mathbb{S}}^\omega}{a @ \sigma \in \vec{\mathbb{S}}} \sqsubseteq, a \in \mathbb{V}$$

$$\frac{\sigma \bullet v \in \vec{\mathbb{S}}^+, (a v) \bullet \sigma' \in \vec{\mathbb{S}}}{(a @ \sigma) \bullet (a v) \bullet \sigma' \in \vec{\mathbb{S}}} \sqsubseteq, v, a \in \mathbb{V}$$

$$\frac{\sigma \in \vec{\mathbb{S}}^\omega}{\sigma @ b \in \vec{\mathbb{S}}} \sqsubseteq$$

$$\frac{\sigma \bullet v \in \vec{\mathbb{S}}^+, (v b) \bullet \sigma' \in \vec{\mathbb{S}}}{(\sigma @ b) \bullet (v b) \bullet \sigma' \in \vec{\mathbb{S}}} \sqsubseteq, v \in \mathbb{V}$$

---

<sup>1</sup> Note:  $a[x \leftarrow b]$  is the capture-avoiding substitution of  $b$  for all free occurrences of  $x$  within  $a$ . We let  $\text{FV}(a)$  be the free variables of  $a$ . We define the call-by-value semantics of closed terms (without free variables)  $\overline{\mathbb{T}} \triangleq \{a \in \mathbb{T} \mid \text{FV}(a) = \emptyset\}$ .

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 29 —

© P. Cousot & R. Cousot

## Fixpoint big-step maximal trace semantics

The bifinitary trace semantics is

$$\vec{\mathbb{S}} = \text{lfp}^{\sqsubseteq} \vec{F}$$

where  $\vec{F} \in \wp(\overline{\mathbb{T}}^\infty) \mapsto \wp(\overline{\mathbb{T}}^\infty)$  is

$$\begin{aligned} \vec{F}(S) \triangleq & \{v \in \overline{\mathbb{T}}^\infty \mid v \in \mathbb{V}\} \cup \\ & \{(\lambda x \cdot a) v \bullet a[x \leftarrow v] \bullet \sigma \mid v \in \mathbb{V} \wedge a[x \leftarrow v] \bullet \sigma \in S\} \cup \\ & \{\sigma @ b \mid \sigma \in S^\omega\} \cup \\ & \{(\sigma @ b) \bullet (v b) \bullet \sigma' \mid \sigma \neq \epsilon \wedge \sigma \bullet v \in S^+ \wedge v \in \mathbb{V} \wedge (v b) \bullet \sigma' \in S\} \cup \\ & \{a @ \sigma \mid a \in \mathbb{V} \wedge \sigma \in S^\omega\} \cup \\ & \{(a @ \sigma) \bullet (a v) \bullet \sigma' \mid a, v \in \mathbb{V} \wedge \sigma \neq \epsilon \wedge \sigma \bullet v \in S^+ \wedge (a v) \bullet \sigma' \in S\}. \end{aligned}$$

© P. Cousot & R. Cousot

# Abstraction to the Bifinitary Relational Semantics of the Eager $\lambda$ -calculus

remember the input/output behaviors,  
forget about the intermediate computation steps

$$\begin{aligned}\alpha(T) &\stackrel{\text{def}}{=} \{\alpha(\sigma) \mid \sigma \in T\} \\ \alpha(\sigma_0 \bullet \sigma_1 \bullet \dots \bullet \sigma_n) &\stackrel{\text{def}}{=} \sigma_0 \Rightarrow \sigma_n \\ \alpha(\sigma_0 \bullet \dots \bullet \sigma_n \bullet \dots) &\stackrel{\text{def}}{=} \sigma_0 \Rightarrow \perp\end{aligned}$$

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 35 —

© P. Cousot & R. Cousot

## Bifinitary Relational Semantics of the Eager $\lambda$ -calculus

$$\begin{array}{c} v \Rightarrow v, \quad v \in \mathbb{V} \\[1ex] \dfrac{a \Rightarrow \perp}{a \ b \Rightarrow \perp} \sqsubseteq \qquad \qquad \qquad \dfrac{b \Rightarrow \perp}{a \ b \Rightarrow \perp} \sqsubseteq, \quad a \in \mathbb{V} \\[1ex] \dfrac{a[x \leftarrow v] \Rightarrow r}{(\lambda x \cdot a) \ v \Rightarrow r} \sqsubseteq, \quad v \in \mathbb{V}, \ r \in \mathbb{V} \cup \{\perp\} \\[1ex] \dfrac{a \Rightarrow v, \quad v \ b \Rightarrow r}{a \ b \Rightarrow r} \sqsubseteq, \quad v \in \mathbb{V}, \ r \in \mathbb{V} \cup \{\perp\} \\[1ex] \dfrac{b \Rightarrow v, \quad a \ v \Rightarrow r}{a \ b \Rightarrow r} \sqsubseteq, \quad a \in \mathbb{V}, \ v \in \mathbb{V}, \ r \in \mathbb{V} \cup \{\perp\}. \end{array}$$

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 36 —

© P. Cousot & R. Cousot

## On the computational ordering $\sqsubseteq$

- For the bifinitary trace semantics  $\mathbb{S}$ , we could replace the computational ordering  $\sqsubseteq$  by  $\supseteq$  (thus taking greatest fixpoints for  $\sqsubseteq$ );
- Impossible for the bifinitary relational semantics!
- Counter-example: the greatest fixpoint starts by assuming that we have the terminating execution

$$(\lambda x \cdot x x)(\lambda x \cdot x x) \Rightarrow (\lambda x \cdot x x)(\lambda x \cdot x x)$$

then the call rule  $\frac{a[x \leftarrow v] \Rightarrow r}{(\lambda x \cdot a) \quad v \Rightarrow r} \sqsubseteq, \quad v \in \mathbb{V}, \quad r \in \mathbb{V} \cup \{\perp\}$  will preserve this invalid hypothesis!

# Abstraction

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 47 —

© P. Cousot & R. Cousot 

## Kleenian abstraction

- $\langle \mathcal{D}, \sqsubseteq, \perp, \sqcup \rangle, \langle \mathcal{D}^\sharp, \sqsubseteq^\sharp, \perp^\sharp, \sqcup^\sharp \rangle$  dcpo's
- $F \in \mathcal{D} \mapsto \mathcal{D}, F^\sharp \in \mathcal{D}^\sharp \mapsto \mathcal{D}^\sharp$  monotone
- $\alpha \in \mathcal{D} \mapsto \mathcal{D}^\sharp$  strict and continuous on chains of  $\mathcal{D}$
- $\alpha \circ F = F^\sharp \circ \alpha$ , commutation condition  
 $\implies \alpha(\text{lfp } \sqsubseteq F) = \text{lfp } \sqsubseteq^\sharp F^\sharp$

OK for abstracting finite behaviors, not infinite ones

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 48 —

© P. Cousot & R. Cousot 

## Tarskian abstraction

- $\langle \mathcal{D}, \sqsubseteq, \perp, \sqcup \rangle, \langle \mathcal{D}^\sharp, \sqsubseteq^\sharp, \perp^\sharp, \sqcup^\sharp \rangle$  dcpos
- $F \in \mathcal{D} \mapsto \mathcal{D}, F^\sharp \in \mathcal{D}^\sharp \mapsto \mathcal{D}^\sharp$  monotone
- $\alpha \in \mathcal{D} \mapsto \mathcal{D}^\sharp$  preserves meets
- $F^\sharp \circ \alpha \sqsubseteq^\sharp \alpha \circ F$ , semi-commutation condition
- $\forall y \in \mathcal{D}^\sharp : (F^\sharp(y) \sqsubseteq^\sharp y) \implies (\exists x \in \mathcal{D} : \alpha(x) = y \wedge F(x) \sqsubseteq x)$   
 $\implies \alpha(\text{lfp } \sqsubseteq F) = \text{lfp } \sqsubseteq^\sharp F^\sharp$

OK for abstracting infinite behaviors, not finite ones  
⇒ abstract by parts.

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 49 —

© P. Cousot & R. Cousot

## Conclusion

Tribute to Neil, København, August 25<sup>th</sup>, 2007

— 50 —

© P. Cousot & R. Cousot

## Conclusion

- Both finite and infinite semantics are needed in static analysis (such as strictness, [Myc80]), typing [Cou97, Ler06], etc;
- Such static analyzes must be proved correct with respect to a semantics chosen at an various level of abstraction (small-step/big-step trace/relational/natural semantics);
- Static analyzes use various equivalent presentations (fixpoints, equational, constraints and inference rules)
- The bifinite extension of SOS *might* satisfy these needs.
