Introduction					Provable Security				
Strong St	Security Notio	ns			Provable	e Security			

Signature

Existential Unforgeability under Chosen-Message Attacks

An adversary, allowed to ask for signature on any message of its choice, cannot generate a new valid message-signature pair

Encryption

Semantic Security against Chosen-Ciphertext Attacks

An adversary that chooses 2 messages, and receives the encryption of one of them, is not able to guess which message has been encrypted, even if it is able to ask for decryption of any ciphertext of its choice (except the challenge ciphertext)

One can prove that:

- if an adversary is able to break the cryptographic scheme
- then one can break the underlying problem (integer factoring, discrete logarithm, 3-SAT, etc)

Provable Security					Provable Security					
Direct Re	duction				Game-b	ased Method	oloav			

Direct Reduction

Unfortunately

- Security may rely on several assumptions
- Proving that the view of the adversary, generated by the simulator, in the reduction is the same as in the real attack game is not easy to do in such a one big step

Illustration: OAEP

[Bellare-Rogaway EC '94]

 Reduction proven indistinguishable for an IND-CCA adversary (actually IND-CCA1, and not IND-CCA2) but widely believed for IND-CCA2, without any further analysis of the reduction The direct-reduction methodology

[Shoup - Crypto '01] Shoup showed the gap for IND-CCA2, under the OWP Granted his new game-based methodology

[Fuiisaki-Okamoto-Pointcheval-Stern - Crypto '01] FOPS proved the security for IND-CCA2, under the PD-OWP Using the game-based methodology

Two Simulators

perfectly identical behaviors

Game 2

[Hop-S-Perfect]

- different behaviors, only if event Ev happens
 - Ev is negligible
 - Ev is non-negligible
 - and independent of the output in Game 4
 - → Simulator B terminates in case of event Ev
- [Hop-S-Negl] [Hop-S-Non-Negl]

- different distributions
 - statistically close
 - computationally close

[Hop-D-Perfect]

[Hop-D-Stat] [Hop-D-Comp]

المعالمة معاما	hahariaan Dalo				a data asti			1 0	
Two Simu	lations				Two Sim	ulations			
Transition Hops					Transition Hops				
00000	0000000000000	00	0000000000000	0	00000	0000000000000	00	0000000000000	0

- Identical behaviors: Pr[Game_A] Pr[Game_B] = 0
 The behaviors differ only if Ev happens:
 - Ev is negligible, one can ignore it Shoup's Lemma: Pr[Game_A] – Pr[Game_B] ≤ Pr[Ev]

 Ev is non-negligible and independent of the output in Game_A, Simulator B terminates in case of event Ev

- Identical behaviors: Pr[Game_A] Pr[Game_B] = 0
- The behaviors differ only if Ev happens:
 - Ev is negligible, one can ignore it
 - Ev is non-negligible and independent of the output in Game_A, Simulator B terminates and outputs 0, in case of event Ev:

$$\begin{split} \mathsf{Pr}[\mathbf{Game}_{\mathcal{B}}] = & \mathsf{Pr}[\mathbf{Game}_{\mathcal{B}}|\mathbf{Ev}] \, \mathsf{Pr}[\mathbf{Ev}] + \mathsf{Pr}[\mathbf{Game}_{\mathcal{B}}|\neg \mathbf{Ev}] \, \mathsf{Pr}[\neg \mathbf{Ev}] \\ = & 0 \times \mathsf{Pr}[\mathbf{Ev}] + \mathsf{Pr}[\mathbf{Game}_{\mathcal{A}}|\neg \mathbf{Ev}] \times \mathsf{Pr}[\neg \mathbf{Ev}] \\ = & \mathsf{Pr}[\mathbf{Game}_{\mathcal{A}}] \times \mathsf{Pr}[\neg \mathbf{Ev}] \end{split}$$

Simulator B terminates and flips a coin, in case of event Ev:

$$\begin{aligned} \Pr[\mathsf{Game}_B] &= \Pr[\mathsf{Game}_B | \mathbf{E}\mathbf{v}] \Pr[\mathbf{E}\mathbf{v}] + \Pr[\mathsf{Game}_B | \neg \mathbf{E}\mathbf{v}] \Pr[\neg \mathbf{E}\mathbf{v}] \\ &= \frac{1}{2} \times \Pr[\mathbf{E}\mathbf{v}] + \Pr[\mathsf{Game}_A | \neg \mathbf{E}\mathbf{v}] \times \Pr[\neg \mathbf{E}\mathbf{v}] \\ &= \frac{1}{2} + (\Pr[\mathsf{Game}_A] - \frac{1}{2}) \times \Pr[\neg \mathbf{E}\mathbf{v}] \end{aligned}$$

David Pointcheval – 17/39

Transition Hops					Transition Hops				
Two Sim	ulations				Two Dis	tributions			

- Identical behaviors: Pr[Game_A] Pr[Game_B] = 0
- The behaviors differ only if Ev happens:
 - Ev is negligible, one can ignore it
 - Ev is non-negligible and independent of the output in Game_A, Simulator B terminates in case of event Ev

Event Ev

- Either Ev is negligible, or the output is independent of Ev
- For being able to terminate simulation B in case of event Ev, this event must be *efficiently* detectable
- For evaluating Pr[Ev], one re-iterates the above process, with an initial game that outputs 1 when event Ev happens

 $\mathsf{Pr}[\textit{Game}_{\textit{A}}] - \mathsf{Pr}[\textit{Game}_{\textit{B}}] \leq Adv(\mathcal{D}^{\text{oracles}})$

Gap Groups

Definition (Pairing Setting)

- Let G1 and G2 be two cyclic groups of prime order p
- Let g_1 and g_2 be generators of \mathbb{G}_1 and \mathbb{G}_2 respectively
- Let $e: \mathbb{G}_1 \times \mathbb{G}_2 \to \mathbb{G}^T$, be a bilinear map

Definition (Admissible Bilinear Map)

Let $(p, \mathbb{G}_1, g_1, \mathbb{G}_2, g_2, \mathbb{G}^T, e)$ be a pairing setting, with $e: \mathbb{G}_1 \times \mathbb{G}_2 \to \mathbb{G}^T$ a non-degenerated bilinear map

• Bilinear: for any $q \in \mathbb{G}_1$, $h \in \mathbb{G}_2$ and $u, v \in \mathbb{Z}$,

$$e(g^u,h^v)=e(g,h)^u$$

• Non-degenerated: $e(g_1, g_2) \neq 1$

We focus on the symmetric case: $\mathbb{G}_1 = \mathbb{G}_2 = \mathbb{G}$

Diffie-Hellman Problems

- CDH in G: Given g, g^a, g^b ∈ G, compute g^{ab}
- **DDH** in G: Given $g, g^a, g^b, g^c \in \mathbb{G}$, decide whether c = ab or not

CDH can be hard to solve, but DDH is easy in gap-groups

Bilinear Diffie-Hellman Problems

- **CBDH** in \mathbb{G} : Given $q, q^a, q^b, q^c \in \mathbb{G}$, compute $e(g,g)^{abc}$
- DBDH in G: Given g, g^a, g^b, g^c ∈ G and h ∈ G^T decide whether $h \stackrel{?}{=} e(q, q)^{abc}$

Challenge	ID				Challen	ae Ciphertext			

 Game₄: True DBDH instance (g, g^α, g^β, g^γ) with h = e(g, g)^{αβγ} Use of the simulation of the Setup Oracle

Simulation of Setup

Setup(): set $P \leftarrow g^{\alpha}$

Modification of the simulation of the Random Oracle

Simulation of \mathcal{H}

If this is the *t*-th query, $\mathcal{H}(\mathcal{ID})$: $M \leftarrow g^{\beta}$, output M

Difference for the *t*-th simulation of the random oracle: we cannot extract the secret key. Since this is the challenge \mathcal{ID} , it cannot be queried to the extraction oracle:

 \implies Hop-D-Perfect: $Pr[Game_4] = Pr[Game_3]$

 Game₅: True DBDH instance (g, g^α, g^β, g^γ) with h = e(g, g)^{αβγ} We have set P ← g^α, and for the *t*-th query to H: M = g^β

Ciphertext

- Set $A \leftarrow g^{\gamma}$ and $K \leftarrow h$ to generate the encryption of m_b under \mathcal{ID}
 - \implies Hop-D-Perfect: $Pr[Game_5] = Pr[Game_4]$
 - Game₆: Random DBDH instance (g, g^α, g^β, g^γ) with h ^R ⊂ C^T ⇒ Hop-D-Comp:

 $|\Pr[\text{Game}_6] - \Pr[\text{Game}_5]| \le Adv^{dbdh}(t + q_{HT_e})$
