

# Overview

---

- Introduction to local features
- Harris interest points + SSD, ZNCC, SIFT
- **Scale & affine invariant interest point detectors**
- Evaluation and comparison of different detectors
- Region descriptors and their performance

# Scale invariance - motivation

---

- Description regions have to be adapted to scale changes

- Interest points have to be repeatable for scale changes

# Harris detector + scale changes

Repeatability rate

$$R(\varepsilon) = \frac{|\{(\mathbf{a}_i, \mathbf{b}_i) \mid \text{dist}(H(\mathbf{a}_i), \mathbf{b}_i) < \varepsilon\}|}{\max(|\mathbf{a}_i|, |\mathbf{b}_i|)}$$

# Scale adaptation

---

Scale change between two images

$$I_1\begin{pmatrix} x_1 \\ y_1 \end{pmatrix} = I_2\begin{pmatrix} x_2 \\ y_2 \end{pmatrix} = I_2\begin{pmatrix} sx_1 \\ sy_1 \end{pmatrix}$$

Scale adapted derivative calculation

# Scale adaptation

---

Scale change between two images

$$I_1\left(\begin{matrix} x_1 \\ y_1 \end{matrix}\right) = I_2\left(\begin{matrix} x_2 \\ y_2 \end{matrix}\right) = I_2\left(\begin{matrix} sx_1 \\ sy_1 \end{matrix}\right)$$

Scale adapted derivative calculation

$$I_1\left(\begin{matrix} x_1 \\ y_1 \end{matrix}\right) \otimes G_{i_1 \dots i_n}(\sigma) = s^n I_2\left(\begin{matrix} x_2 \\ y_2 \end{matrix}\right) \otimes G_{i_1 \dots i_n}(s\sigma)$$

# Scale adaptation

---

$$G(\tilde{\sigma}) \otimes \begin{bmatrix} L_x^2(\sigma) & L_x L_y(\sigma) \\ L_x L_y(\sigma) & L_y^2(\sigma) \end{bmatrix}$$

where  $L_i(\sigma)$  are the derivatives with Gaussian convolution

# Scale adaptation

---

$$G(\tilde{\sigma}) \otimes \begin{bmatrix} L_x^2(\sigma) & L_x L_y(\sigma) \\ L_x L_y(\sigma) & L_y^2(\sigma) \end{bmatrix}$$

where  $L_i(\sigma)$  are the derivatives with Gaussian convolution

Scale adapted auto-correlation matrix

$$s^2 G(s\tilde{\sigma}) \otimes \begin{bmatrix} L_x^2(s\sigma) & L_x L_y(s\sigma) \\ L_x L_y(s\sigma) & L_y^2(s\sigma) \end{bmatrix}$$

100% correct matches (13 matches)

# Scale selection

---

- For a point compute a value (gradient, Laplacian etc.) at several scales
- Normalization of the values with the scale factor  
e.g. Laplacian  $|s^2(L_{xx} + L_{yy})|$
- Select scale  $s^*$  at the maximum  $\rightarrow$  characteristic scale

- Exp. results show that the Laplacian gives best results

# Scale selection

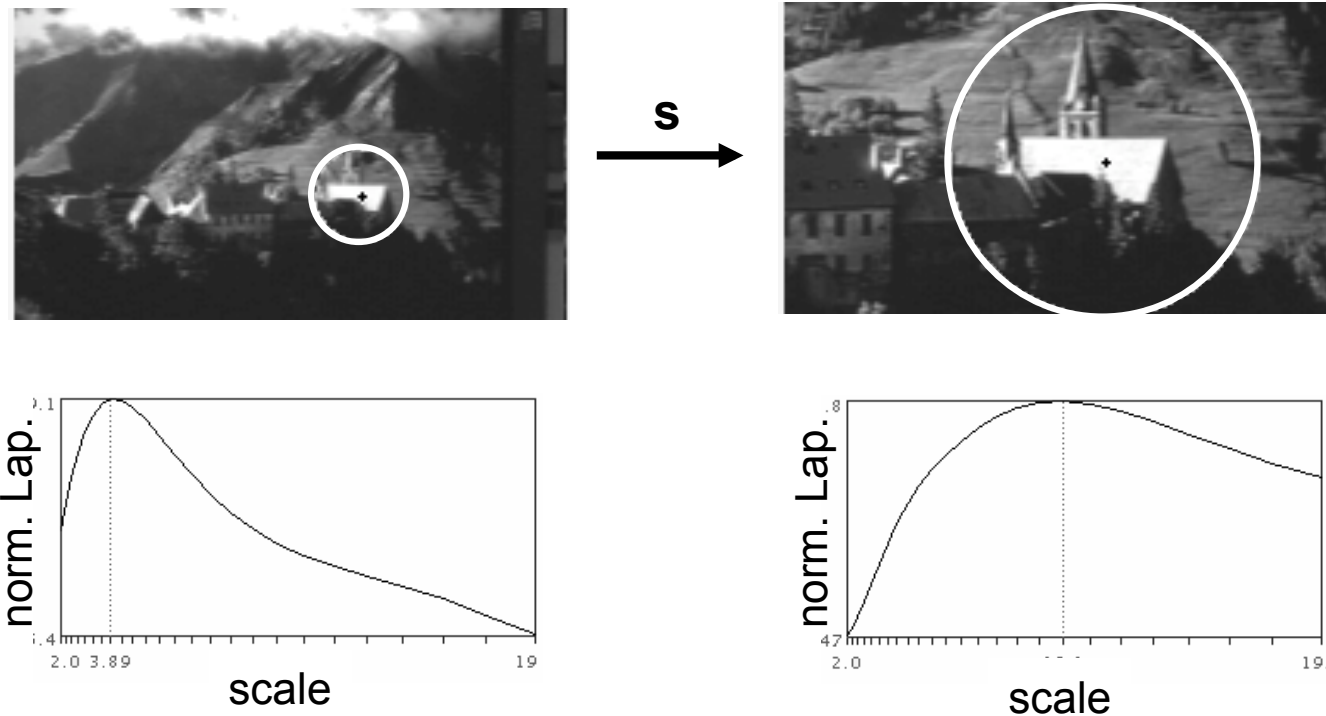

---

- Scale invariance of the characteristic scale

# Scale selection

- Scale invariance of the characteristic scale

- Relation between characteristic scales  $s \cdot s_1^* = s_2^*$

# Scale-invariant detectors

---

- Harris-Laplace (Mikolajczyk & Schmid'01)
- Laplacian detector (Lindeberg'98)
- Difference of Gaussian (Lowe'99)

Harris-Laplace

Laplacian

# Harris-Laplace

---

multi-scale Harris points

selection of points at  
maximum of Laplacian

➡ invariant points + associated regions [Mikolajczyk & Schmid'01]

# Matching results

---

213 / 190 detected interest points

# Matching results

---

58 points are initially matched

# Matching results

---

32 points are matched after verification – all correct

# Matching results

---

all matches are correct (33)

# Laplacian of Gaussian (LOG)

---

$$LOG = G_{xx}(\sigma) + G_{yy}(\sigma)$$

# LOG detector

---

Detection of maxima and minima of Laplacian in scale space

# Difference of Gaussian (DOG)

---

- Difference of Gaussian approximates the Laplacian

$$DOG = G(k\sigma) - G(\sigma)$$

# DOG detector

- Fast computation, scale space processed one octave at a time

# Local features - overview

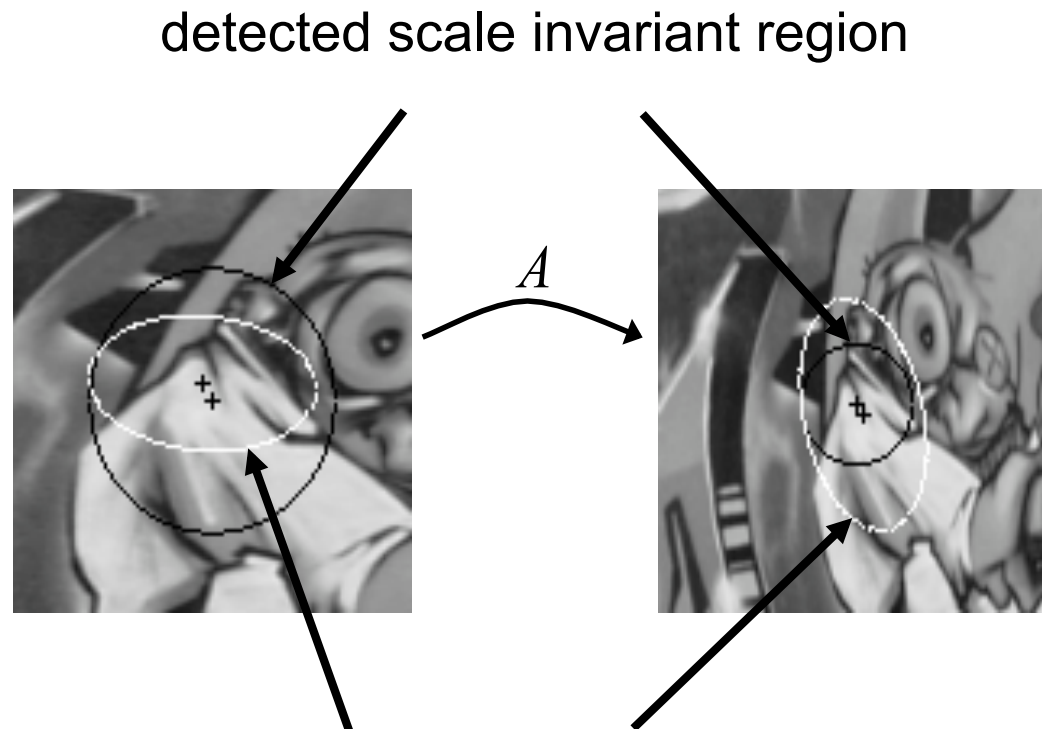

---

- Scale invariant interest points
- ***Affine invariant interest points***
- Evaluation of interest points
- Descriptors and their evaluation

# Affine invariant regions - Motivation

---

- Scale invariance is not sufficient for large baseline changes

projected regions, viewpoint changes can locally be approximated by an affine transformation  $A$

# Affine invariant regions - Motivation

---

# Affine invariant regions - Example

---

# Harris/Hessian/Laplacian-Affine

---

- Initialize with scale-invariant Harris/Hessian/Laplacian points
- Estimation of the affine neighbourhood with the second moment matrix [Lindeberg'94]
- Apply affine neighbourhood estimation to the scale-invariant interest points [Mikolajczyk & Schmid'02, Schaffalitzky & Zisserman'02]
- Excellent results in a recent comparison

# Affine invariant regions

---

- Based on the second moment matrix (Lindeberg'94)

$$M = \mu(\mathbf{x}, \sigma_I, \sigma_D) = \sigma_D^2 G(\sigma_I) \otimes \begin{bmatrix} L_x^2(\mathbf{x}, \sigma_D) & L_x L_y(\mathbf{x}, \sigma_D) \\ L_x L_y(\mathbf{x}, \sigma_D) & L_y^2(\mathbf{x}, \sigma_D) \end{bmatrix}$$

- Normalization with eigenvalues/eigenvectors

$$\mathbf{x}' = M^{\frac{1}{2}} \mathbf{x}$$

# Maximally stable extremal regions (MSER) [Matas'02]

---

- Extremal regions: connected components in a thresholded image (all pixels above/below a threshold)
- Maximally stable: minimal change of the component (area) for a change of the threshold, i.e. region remains stable for a change of threshold
- Excellent results in a recent comparison

# Maximally stable extremal regions (MSER)

---

## Examples of thresholded images

high threshold

low threshold

# MSER

- Scale & affine invariant interest point detectors
- **Evaluation and comparison of different detectors**
- Region descriptors and their performance

# Evaluation of interest points

---

- Quantitative evaluation of interest point/region detectors
  - points / regions at the same relative location and area
- Repeatability rate : percentage of corresponding points
- Two points/regions are corresponding if
  - location error small
  - area intersection large
- [K. Mikolajczyk, T. Tuytelaars, C. Schmid, A. Zisserman, J. Matas, F. Schaffalitzky, T. Kadir & L. Van Gool '05]

# Evaluation criterion

---

$$\text{repeatability} = \frac{\# \text{corresponding regions}}{\# \text{detected regions}} \cdot 100\%$$

# Evaluation criterion

---

$$repeatability = \frac{\# \text{corresponding regions}}{\# \text{detected regions}} \cdot 100\%$$

$$overlap\ error = (1 - \frac{intersection}{union}) \cdot 100\%$$

# Dataset

---

- Different types of transformation
  - Viewpoint change
  - Scale change
  - Image blur
  - JPEG compression
  - Light change
- Two scene types
  - Structured
  - Textured
- Transformations within the sequence (homographies)
  - Independent estimation

# Conclusion - detectors

---

- Good performance for large viewpoint and scale changes
- Results depend on transformation and scene type, no one best detector
- Detectors are complementary
  - MSER adapted to structured scenes
  - Harris and Hessian adapted to textured scenes
- Performance of the different scale invariant detectors is very similar (Harris-Laplace, Hessian-Laplace, LoG and DOG)
- Scale-invariant detector sufficient up to 40 degrees of viewpoint change

# Overview

---

- Introduction to local features
- Harris interest points + SSD, ZNCC, SIFT
- Scale & affine invariant interest point detectors
- Evaluation and comparison of different detectors
- **Region descriptors and their performance**

# Region descriptors

---

- Normalized regions are
  - invariant to geometric transformations except rotation
  - not invariant to photometric transformations

# Descriptors

---

- Regions invariant to geometric transformations except rotation
  - rotation invariant descriptors
  - **normalization with dominant gradient direction**
- Regions not invariant to photometric transformations
  - invariance to affine photometric transformations
  - **normalization with mean and standard deviation of the image patch**

# Descriptors

---

- Sampled image patch
  - descriptor dimension is 81

- Gaussian derivative-based descriptors
  - Differential invariants (*Koenderink and van Doorn'87*) (dim. 8)

# Descriptors

---

- Gaussian derivative-based descriptors
  - Steerable filters (*Freeman and Adelson'91*)
  - “Steering the derivatives in the direction of an angle “

$$f'(\theta) = I_x \cos \theta + I_y \sin \theta$$

$$f''(\theta) = I_{xx} \cos^2 \theta + 2I_x I_y \sin \theta \cos \theta + I_{yy} \sin^2 \theta$$

$$\theta_{n,i} = \theta_g + i / (n + 1) \Pi \quad i = 0 \dots n$$

- Dominant gradient direction is rotation invariant

# Descriptors

---

- SIFT [Lowe'99]
  - 8 orientations of the gradient (dim. 128)
  - 4x4 spatial grid
  - normalization of the descriptor to norm one

image patch

3D histogram

# Descriptors

---

- Moment invariants [Van Gool et al.'96]
- Shape context [Belongie et al.'02]
- SIFT with PCA dimensionality reduction
- Gradient PCA [Ke and Sukthankar'04]

# Comparison criterion

---

- Descriptors should be
  - Distinctive
  - Robust to changes on viewing conditions as well as to errors of the detector
- Detection rate (recall)
  - $\text{\#correct matches} / \text{\#correspondences}$
- False positive rate
  - $\text{\#false matches} / \text{\#all matches}$
- Variation of the distance threshold
  - $\text{distance}(d_1, d_2) < \text{threshold}$

[K. Mikolajczyk & C. Schmid, PAMI'05]

# Viewpoint change (60 degrees)

# Scale change (factor 2.8)

# Conclusion - descriptors

---

- SIFT based descriptors perform best
- Significant difference between SIFT and low dimension descriptors as well as cross-correlation
- Robust region descriptors better than point-wise descriptors
- Performance of the descriptor is relatively independent of the detector

# Available on the internet
