Tomography

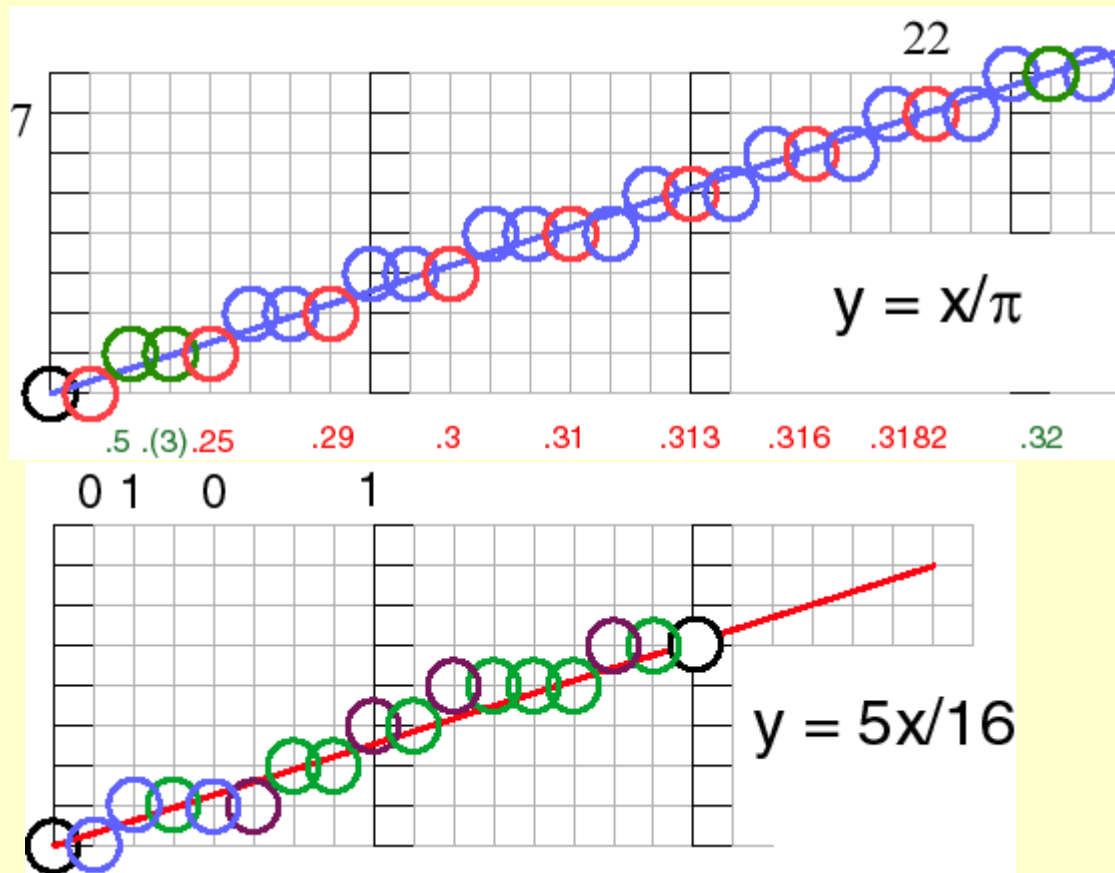

Discrete Straight Line

Draw a digital straight line?

Reduce to: $y = s x$ and $0 \leq s < 1$.

Choose pixel nearest to the line.

$$\mathfrak{B}_s = \left\{ \left(N, \left\lfloor sN + \frac{1}{2} \right\rfloor \right) : N \in \mathbb{N} \right\}$$

Recursive \neq Bresenham, is not relevant to CERN application.

Discrete Hough Transform

$$\mathcal{L}_{i,h} = \left\{ (x,y) : y = i + x \frac{h}{N} \right\}$$

$$H_{2,-1} = 0 + 1 + 2 + 0 = 3$$

$$H_{0,1} = 0 + 0 + 2 + 0 = 2$$

$$H_{i,h} = \sum_{(x,y) \in \mathcal{L}_{i,h}} p_{x,y}$$

Fast Hough Transform

$$H_0(0, i, j) = \text{pixel}(i, j)$$

$$H_{p+1}(2h, i, j) = H_p(h, i, j) + H_p(h, i + 2^p, j + h)$$

$$H_{p+1}(2h + 1, i, j) = H_p(h, i, j) + H_p(h, i + 2^p, j + h + 1) \quad h > 0$$

$$H_{p+1}(2h - 1, i, j) = H_p(h, i, j) + H_p(h, i + 2^p, j + h - 1) \quad h < 0$$

For $N=2^n$, the complexity of the FHT is:

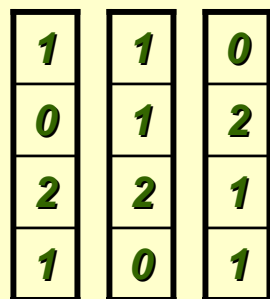

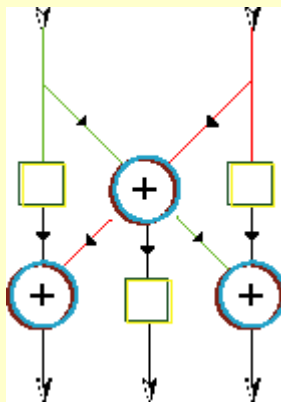

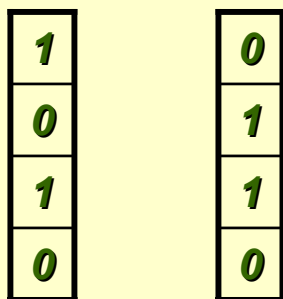

$$(2n-1)N^2 - N$$

additions on $n+p$ bits.

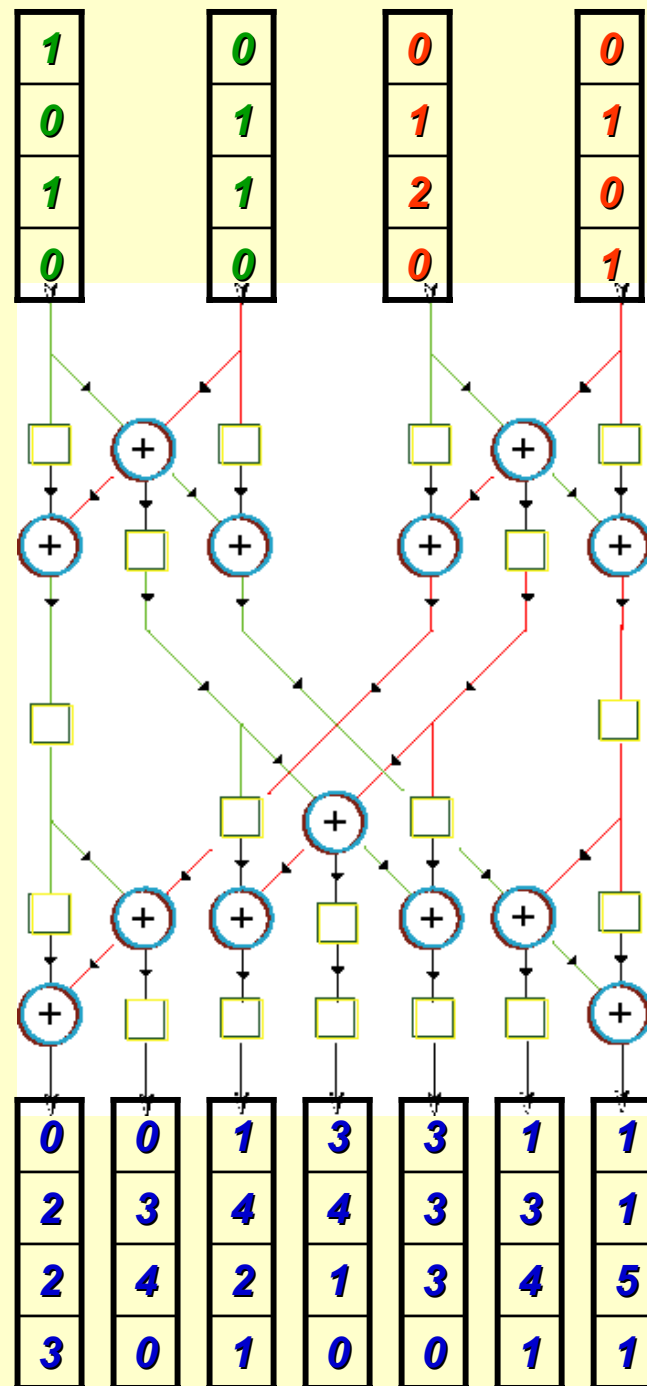

Additions, for $N=32$:

- Naïve $O(N^3)$: **64512**
- FHT $O(N^2 \log(N))$: **9248**
- Software speed-up: **x7**
