Formal Verification of Machine Learning

MPRI 2-6: Abstract Interpretation, Application to Verification and Static Analysis

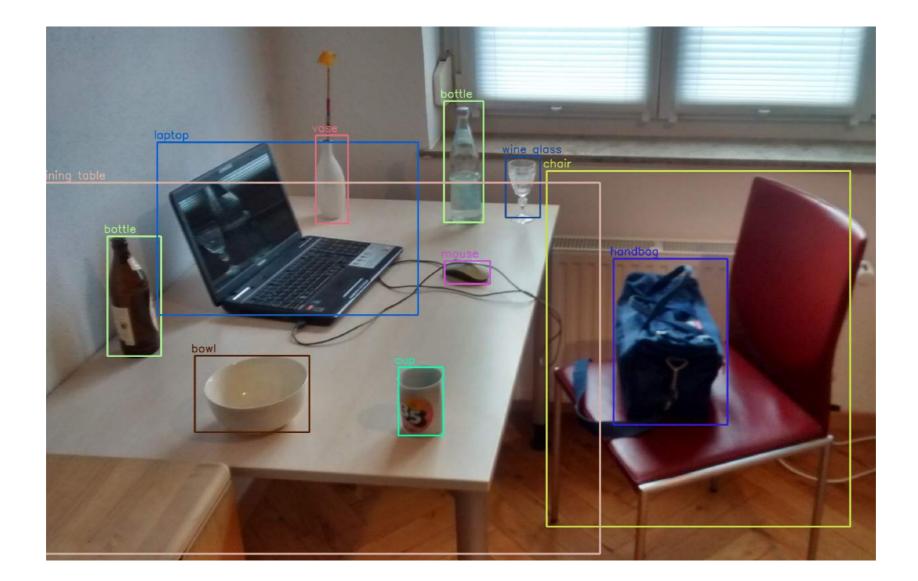

Caterina Urban

November 14th, 2022

Year 2022-2023

Machine Learning Revolution

Computer software able to efficiently and **autonomously perform tasks** that are difficult or even *impossible* to design using explicit programming

Examples: object recognition, image classification, speech recognition, etc.

.....

floating point storage. A simple technique to reduce the size of the score table is to downsample the table after dynamic programming. To minimize the degradation in decision quality, states are removed in areas where the variation between values in the table are smooth. The downsampling reduces the size of the table by a factor of 180 from that produced by dynamic programming. For the rest of this paper, the downsampled ACAS Xu horizontal table is referred to as the baseline, original table.

the current table requires over

Abstract—One approach to designing decision making logic for an aircraft collision avoidance system frames the problem as a Markov decision process and optimizes the system using dynamic programming. The resulting collision avoidance strategy can be represented as a numeric table. This methodology has been used in the development of the Airborne Collision Avoidance System X (ACAS X) family of collision avoidance systems for manned and unmanned aircraft, but the high dimensionality of the state space tables To improve storage efficiency, a deep

model deployment

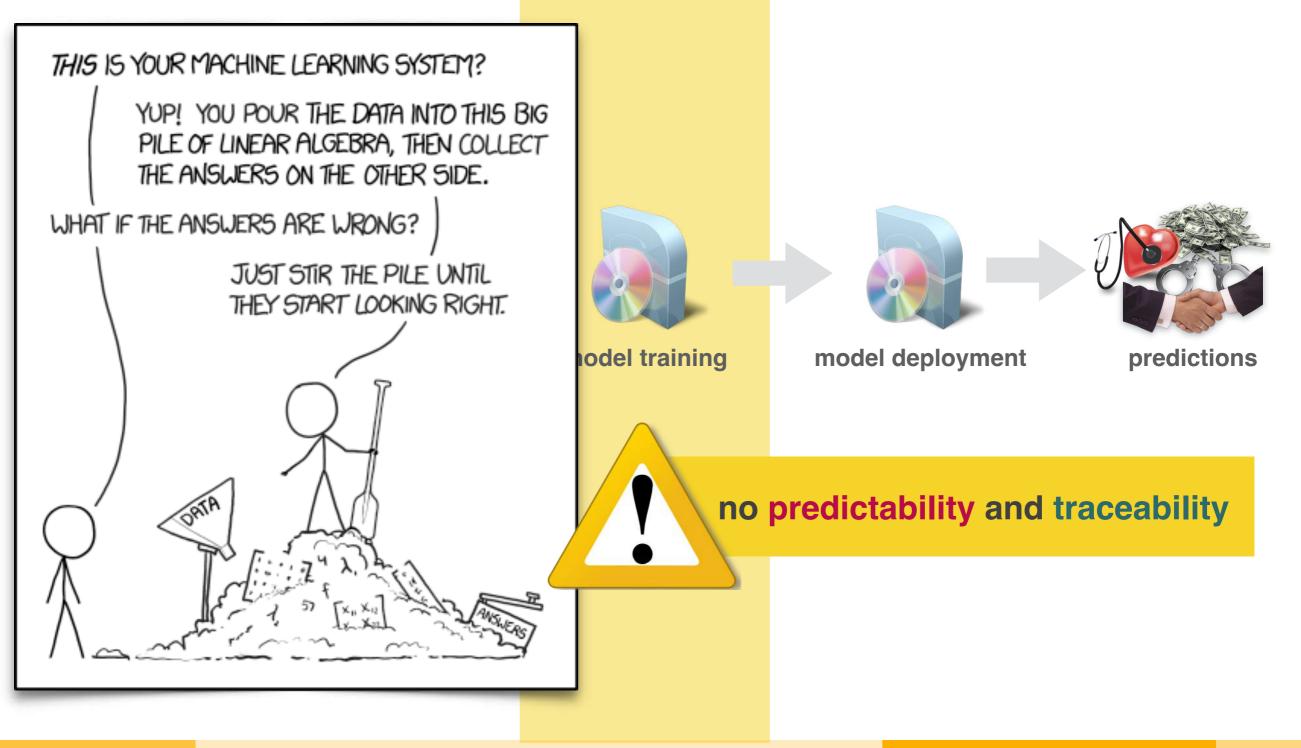

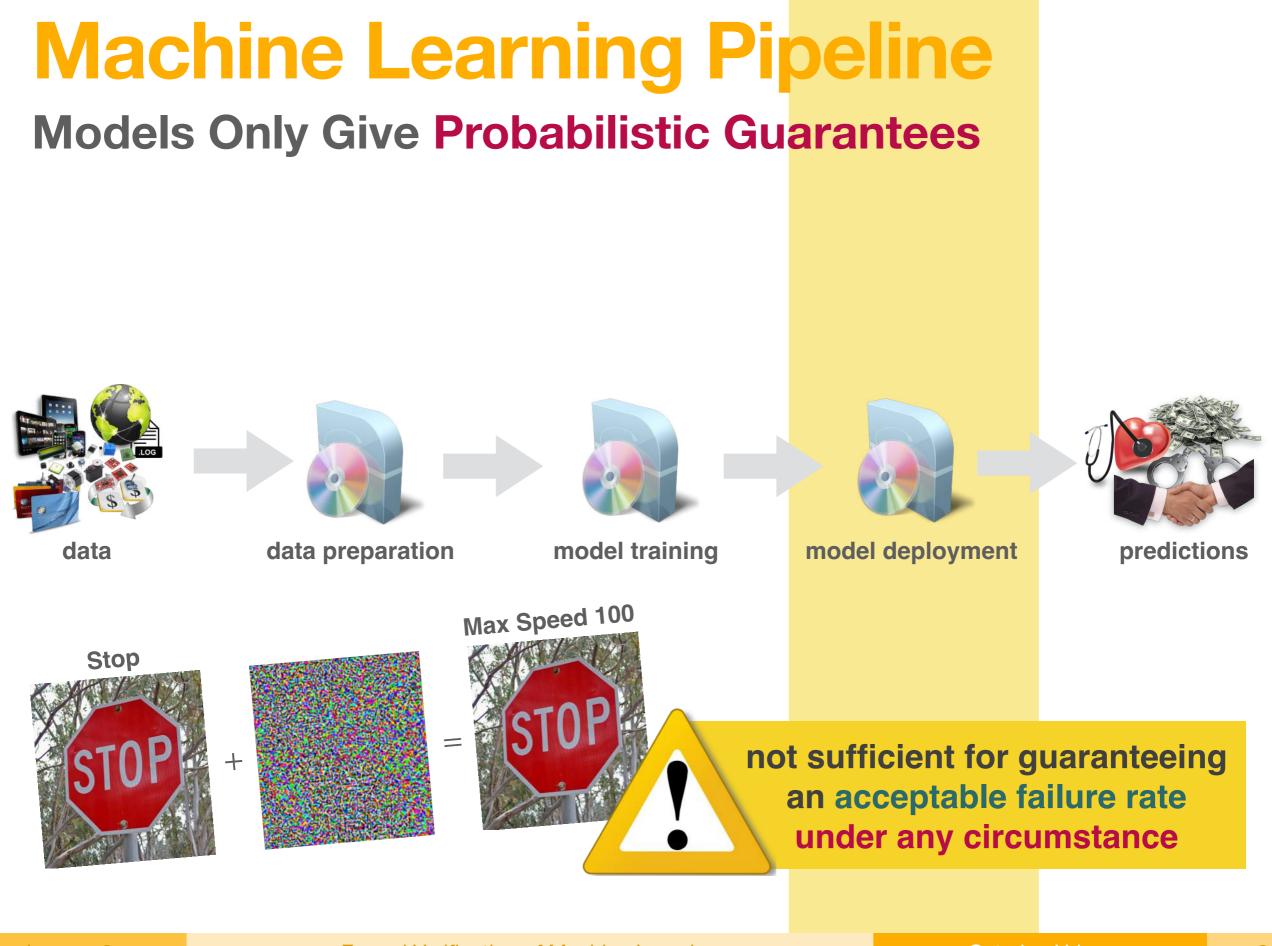

predictions

Machine Learning Pipeline

Model Training is Highly Non-Deterministic

Formal Methods Mathematical Guarantees of Safety

Deductive Verification

- extremely expressive ٠
- relies on the user to guide the proof •

Radhia Cousot

Model Checking

- analysis of a **model** of the software
- with respect to the model

Static Analysis

- analysis of the software at some level of abstraction
- fully automatic and sound by construction
- generally not complete

Fairness

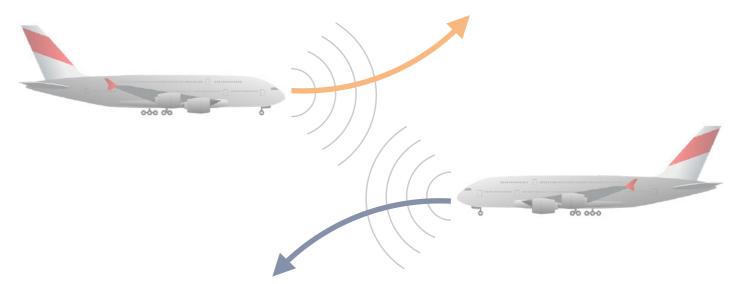

Stability

Goal G3 in [Kurd03]

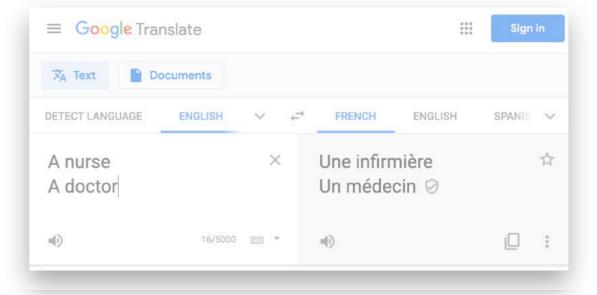

Safety

Goal G4 in [Kurd03]

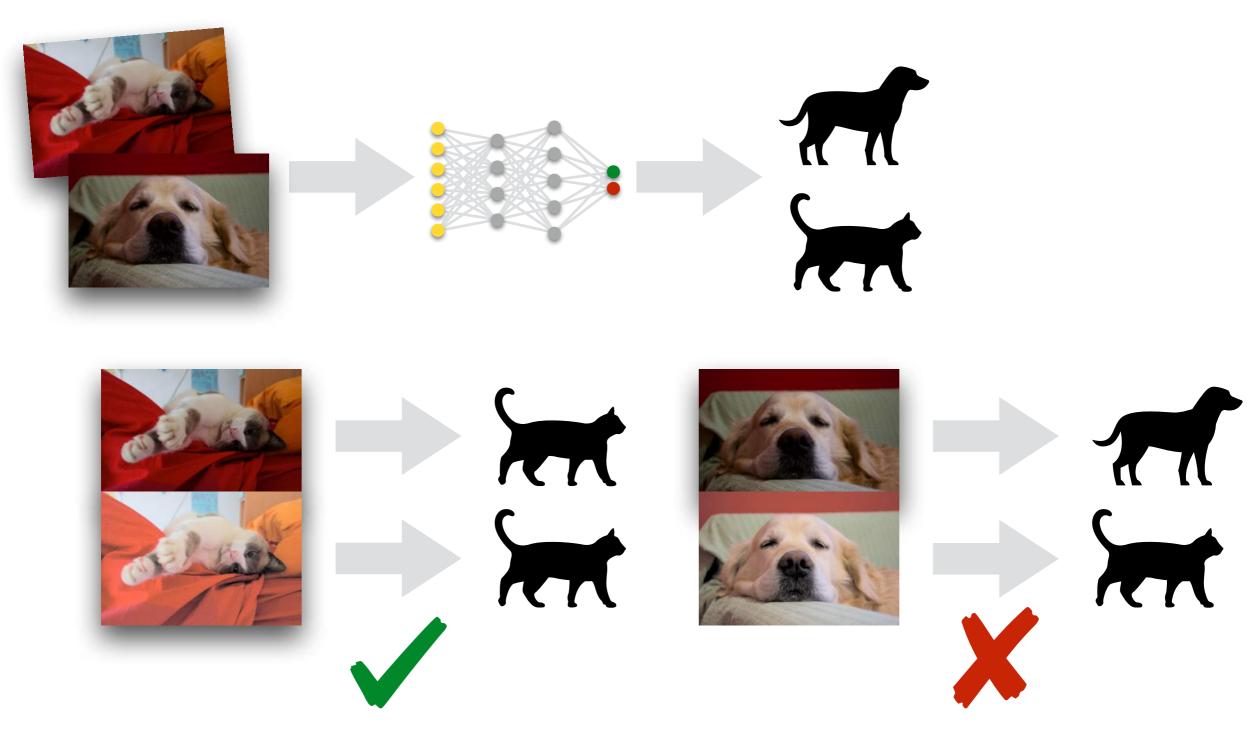

Local Stability

The classification is unaffected by small input perturbations

Local Stability

Distance-Based Perturbations

 $P_{\delta,\epsilon}(\mathbf{x}) \stackrel{\mathsf{def}}{=} \{ \mathbf{x}' \in \mathscr{R}^{|L_0|} \mid \delta(\mathbf{x}, \mathbf{x}') \le \epsilon \}$

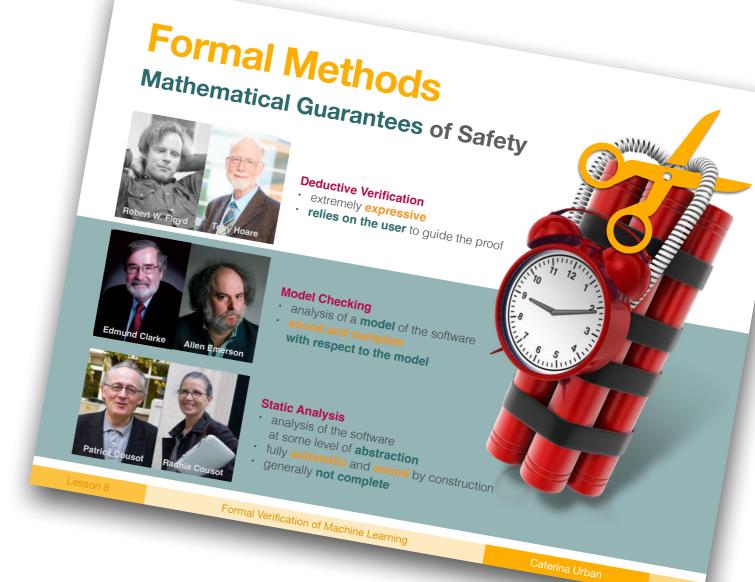

Example (L_{∞} distance): $P_{\infty,\epsilon}(\mathbf{x}) \stackrel{\text{def}}{=} \{\mathbf{x}' \in \mathscr{R}^{|L_0|} \mid \max_i |\mathbf{x}_i - \mathbf{x}'_i| \le \epsilon\}$

$\mathscr{R}_{\mathbf{x}}^{\delta,\epsilon} \stackrel{\mathsf{def}}{=} \{\llbracket M \rrbracket \in \mathscr{P}(\Sigma^*) \mid \mathsf{STABLE}_{\mathbf{x}}^{\delta,\epsilon}(\llbracket M \rrbracket)\}$

 $\mathscr{R}^{\delta,\epsilon}_{\mathbf{x}}$ is the set of all neural networks M (or, rather, their semantics [[M]]) that are **stable** in the neighborhood $P_{\delta,\epsilon}(\mathbf{x})$ of a given input \mathbf{x}

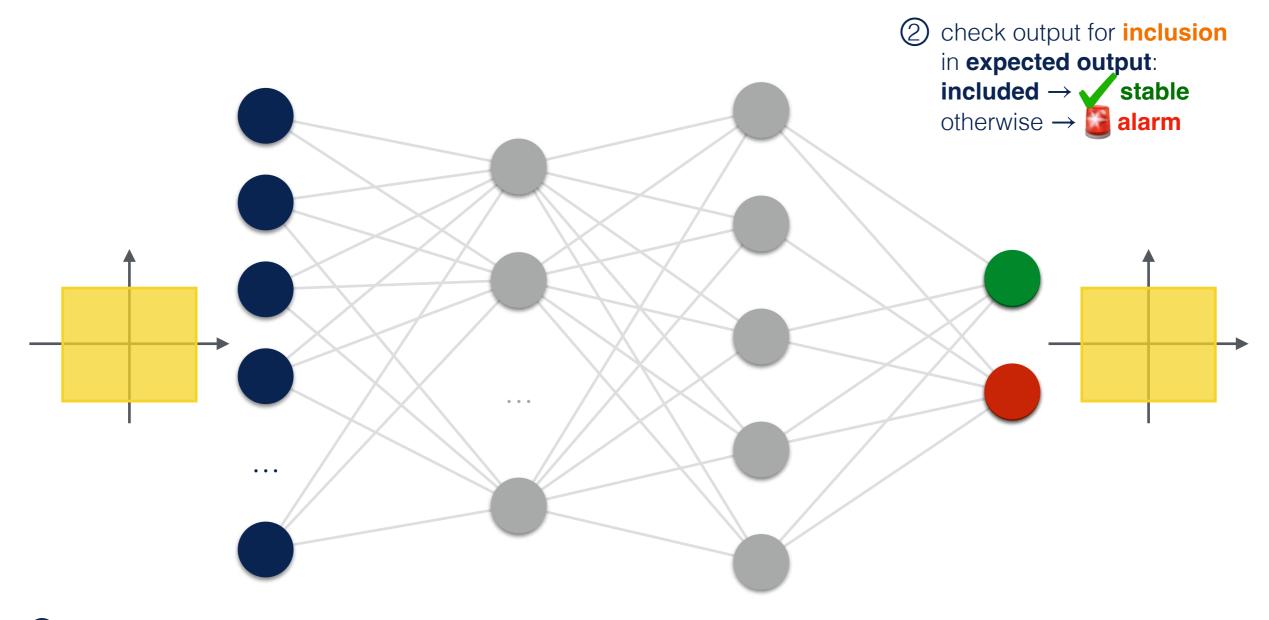

$$\begin{aligned} \mathsf{STABLE}_{\mathbf{x}}^{\delta,\epsilon}(\llbracket M \rrbracket) \stackrel{\mathsf{def}}{=} \forall t \in \llbracket M \rrbracket : (\exists t' \in \llbracket M \rrbracket : \forall 0 \le i \le |L_0| : t'_0(x_{0,i}) = \mathbf{x}_i) \\ & \wedge (\exists \mathbf{x}' \in P_{\delta,\epsilon}(\mathbf{x}) : \forall 0 \le i \le |L_0| : t_0(x_{0,i}) = \mathbf{x}'_i) \\ & \Rightarrow \max_j t_{\omega}(x_{N,j}) = \max_j t'_{\omega}(x_{N,j}) \end{aligned}$$

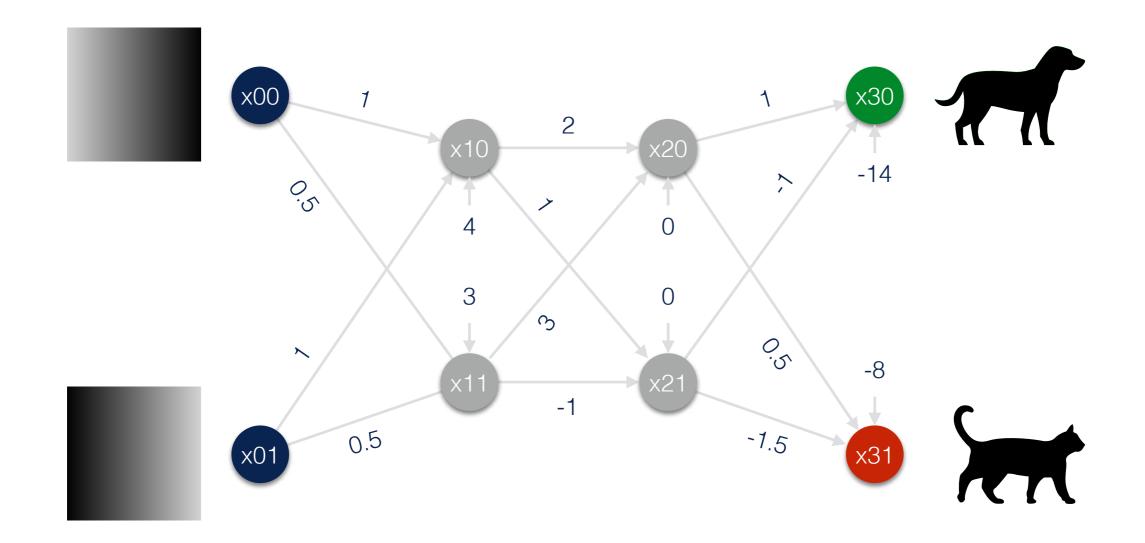

Static Analysis Methods

Forward Analysis

 proceed forwards from an abstraction of all possible perturbations

 $P(\langle 0.5, 0.75 \rangle) \stackrel{\mathsf{def}}{=} \{ \mathbf{x} \in \mathcal{R} \times \mathcal{R} \mid 0 \leq \mathbf{x}_0 \leq 1 \land 0 \leq \mathbf{x}_1 \leq 1 \}$

 $x_{i,j} \mapsto [a,b]$ $a,b \in \mathcal{R}$

Formal Verification of Machine Learning

Complete Methods

Advantages

sound and complete

Disadvantages

soundness not typically guaranteed with respect to floating-point arithmetic

do not scale to large models

often limited to certain model architectures

suffer from false positives

Disadvantages

able to scale to large models

sound often also with respect to floating-point arithmetic

Incomplete Methods

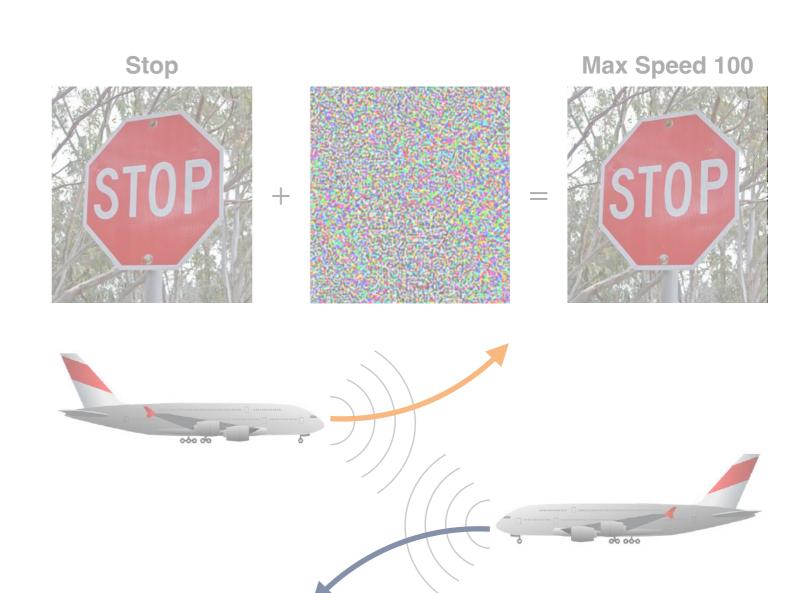

less limited to certain model architectures

Fairness

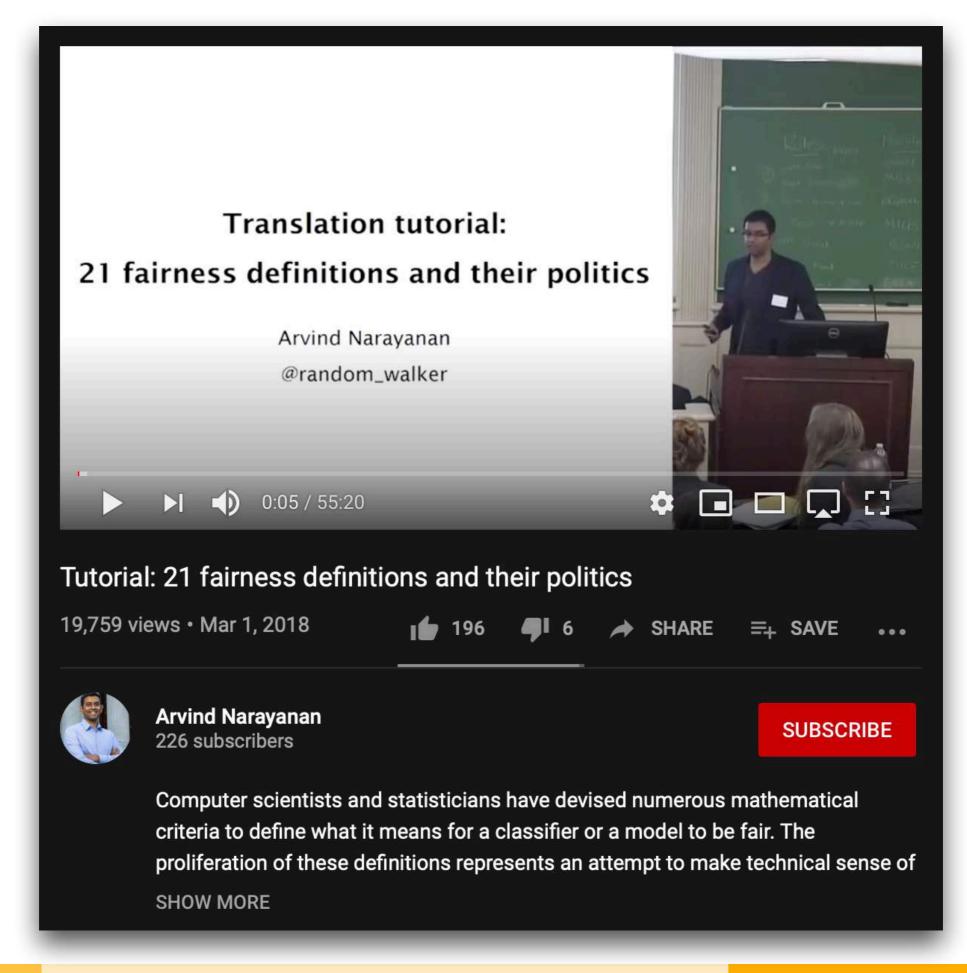

Lesson 8

Formal Verification of Machine Learning

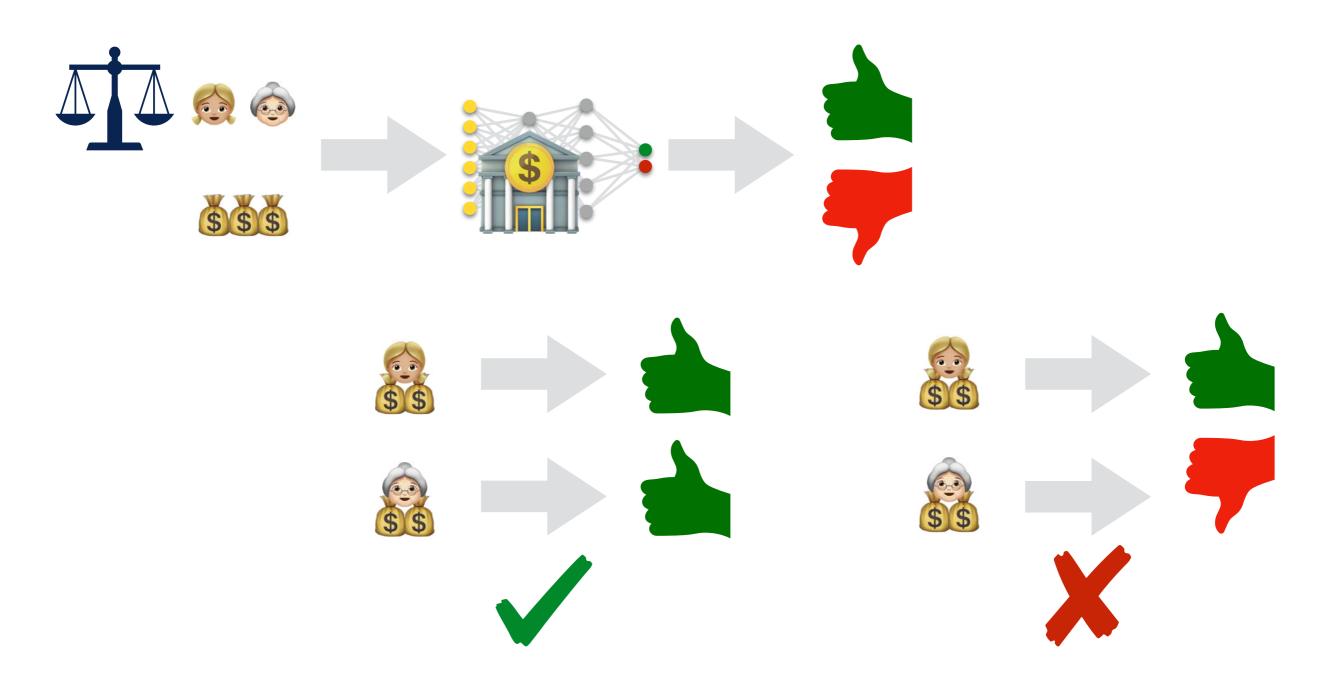

Lesson 8

Formal Verification of Machine Learning

Dependency Fairness [Galhotra17]

The classification is independent of the values of the sensitive inputs

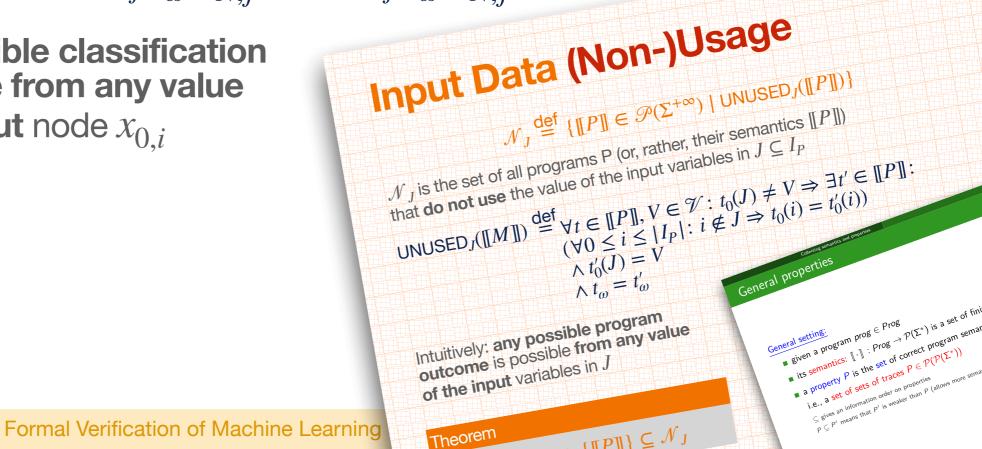

Dependency Fairness

 $\mathcal{F}_i \stackrel{\mathsf{def}}{=} \{\llbracket M \rrbracket \in \mathscr{P}(\Sigma^*) \mid \mathsf{UNUSED}_i(\llbracket M \rrbracket)\}$

 \mathcal{F}_i is the set of all neural networks M (or, rather, their semantics [[M]]) that **do not use** the value of the sensitive input node $x_{0,i}$ for classification

$$\begin{aligned} \mathsf{UNUSED}_{i}(\llbracket M \rrbracket) &\stackrel{\text{def}}{=} \forall t \in \llbracket M \rrbracket, v \in \mathscr{R} \colon t_{0}(x_{0,i}) \neq v \Rightarrow \exists t' \in \llbracket M \rrbracket : \\ & (\forall 0 \leq j \leq |L_{0}| : j \neq i \Rightarrow t_{0}(x_{0,j}) = t'_{0}(x_{0,j})) \\ & \wedge t'_{0}(x_{0,i}) = v \\ & \wedge \max_{i} t_{\omega}(x_{N,i}) = \max_{i} t'_{\omega}(x_{N,i}) \end{aligned}$$

Intuitively: any possible classification outcome is possible from any value of the sensitive input node $x_{0,i}$

Dependency Fairness <u>í</u> \$\$\$ $\mathcal{F}_{\underline{\Diamond}}$ \$ **\$** <u>(</u>) \$\$ \$\$ \$

Dependency Fairness

 $\mathcal{F}_i \stackrel{{\rm def}}{=} \{\llbracket M \rrbracket \in \mathscr{P}(\Sigma^*) \mid \mathsf{UNUSED}_i(\llbracket M \rrbracket)\}$

 \mathcal{F}_i is the set of all neural networks M (or, rather, their semantics [[M]]) that **do not use** the value of the sensitive input node $x_{0,i}$ for classification

$$\begin{aligned} \mathsf{UNUSED}_i(\llbracket M \rrbracket) \stackrel{\mathsf{def}}{=} \forall t \in \llbracket M \rrbracket, v \in \mathscr{R} \colon t_0(x_{0,i}) \neq v \Rightarrow \exists t' \in \llbracket M \rrbracket : \\ (\forall 0 \leq j \leq |L_0| \colon j \neq i \Rightarrow t_0(x_{0,j}) = t'_0(x_{0,j})) \\ \wedge t'_0(x_{0,i}) = v \\ \wedge \max_j t_\omega(x_{N,j}) = \max_j t'_\omega(x_{N,j}) \end{aligned}$$

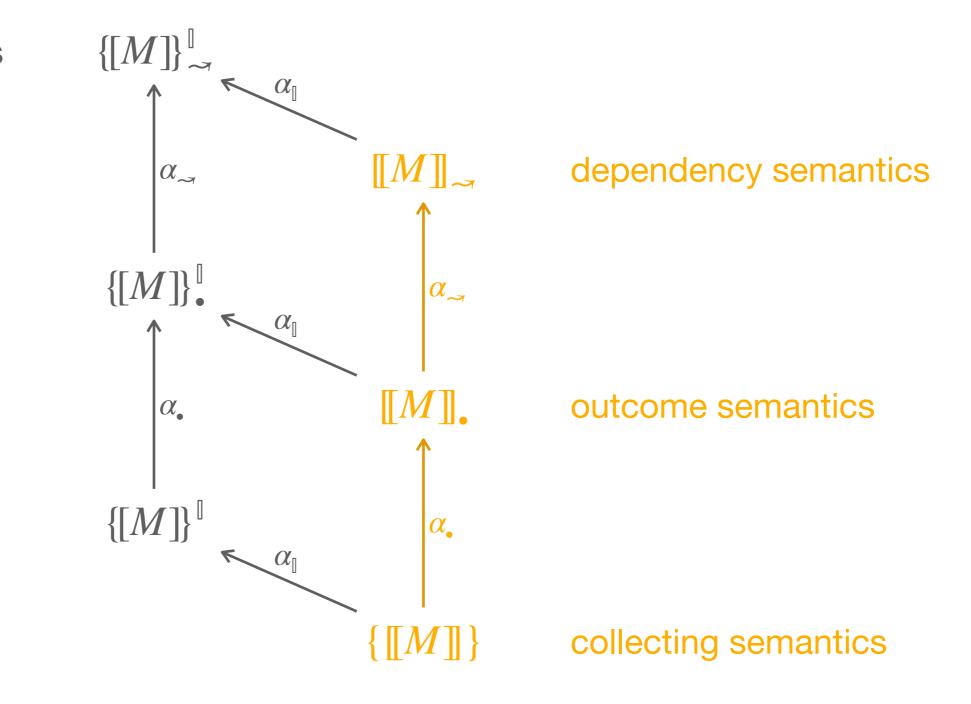

Intuitively: any possible classification outcome is possible from any value of the sensitive input node $x_{0,i}$

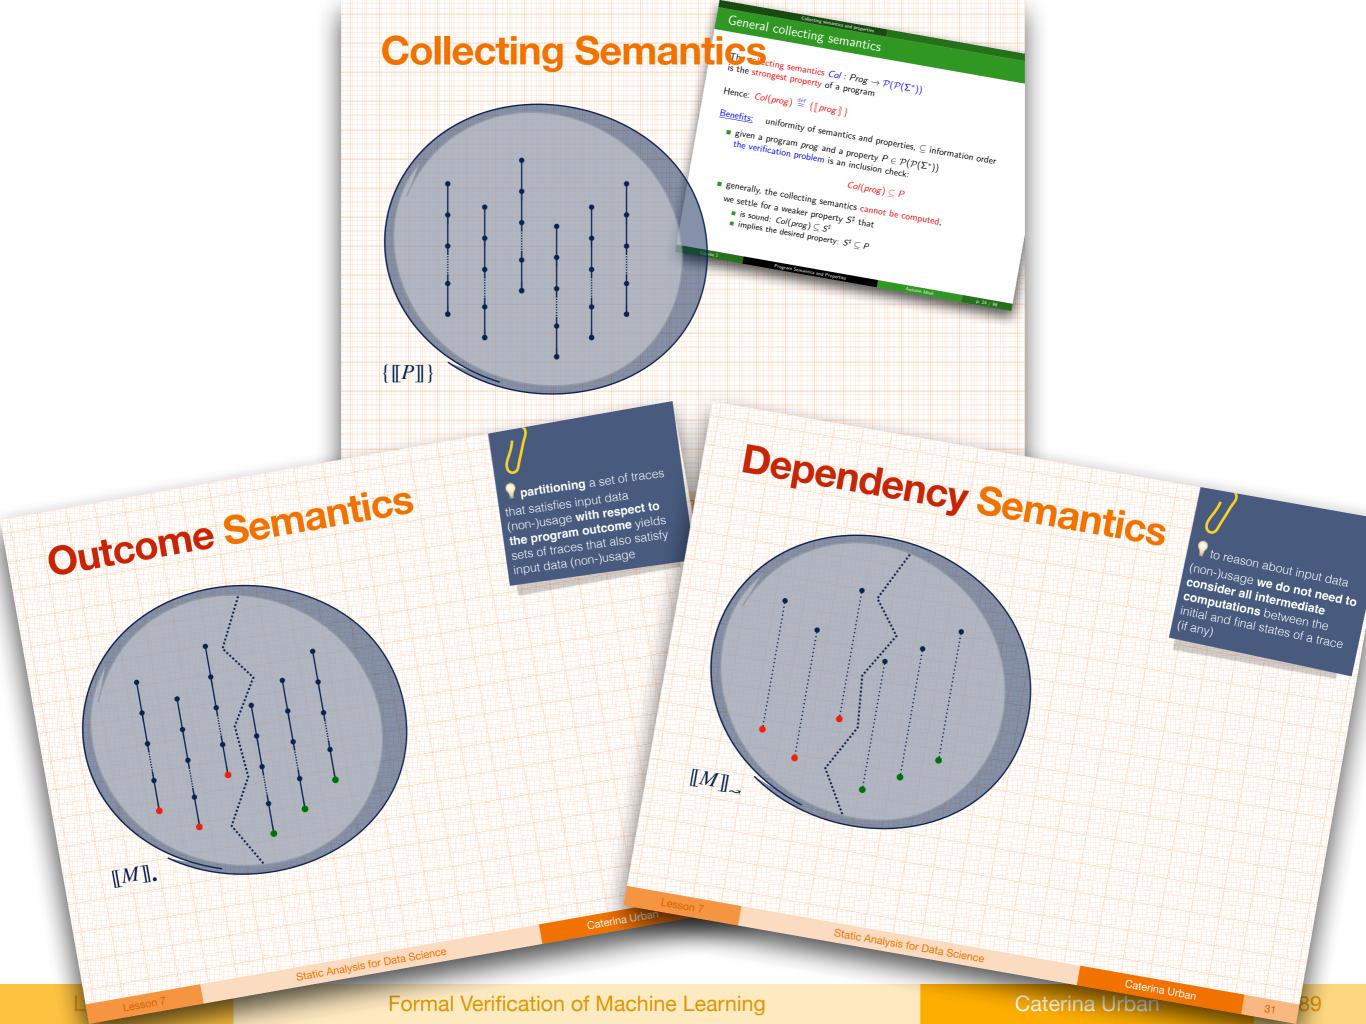

Theorem

 $M \models \mathscr{F}_i \Leftrightarrow \{\llbracket M \rrbracket\} \subseteq \mathscr{F}_i$

Hierarchy of Semantics

parallel semantics

Dependency Semantics

partitioning with respect to the outcome classification **induces a partition of the** space of **values** of the input nodes **used** for classification

Lemma

 $\mathcal{F}_{\underline{\Diamond}}$

\$\$\$

\$\$

 $M \models \mathcal{F}_i \Leftrightarrow \forall A, B \in \llbracket M \rrbracket_{\prec} \colon (A_{\omega} \neq B_{\omega} \Rightarrow A_0 |_{\neq i} \cap B_0 |_{\neq i} = \emptyset)$

\$

...\$

\$\$

Naïve Abstraction

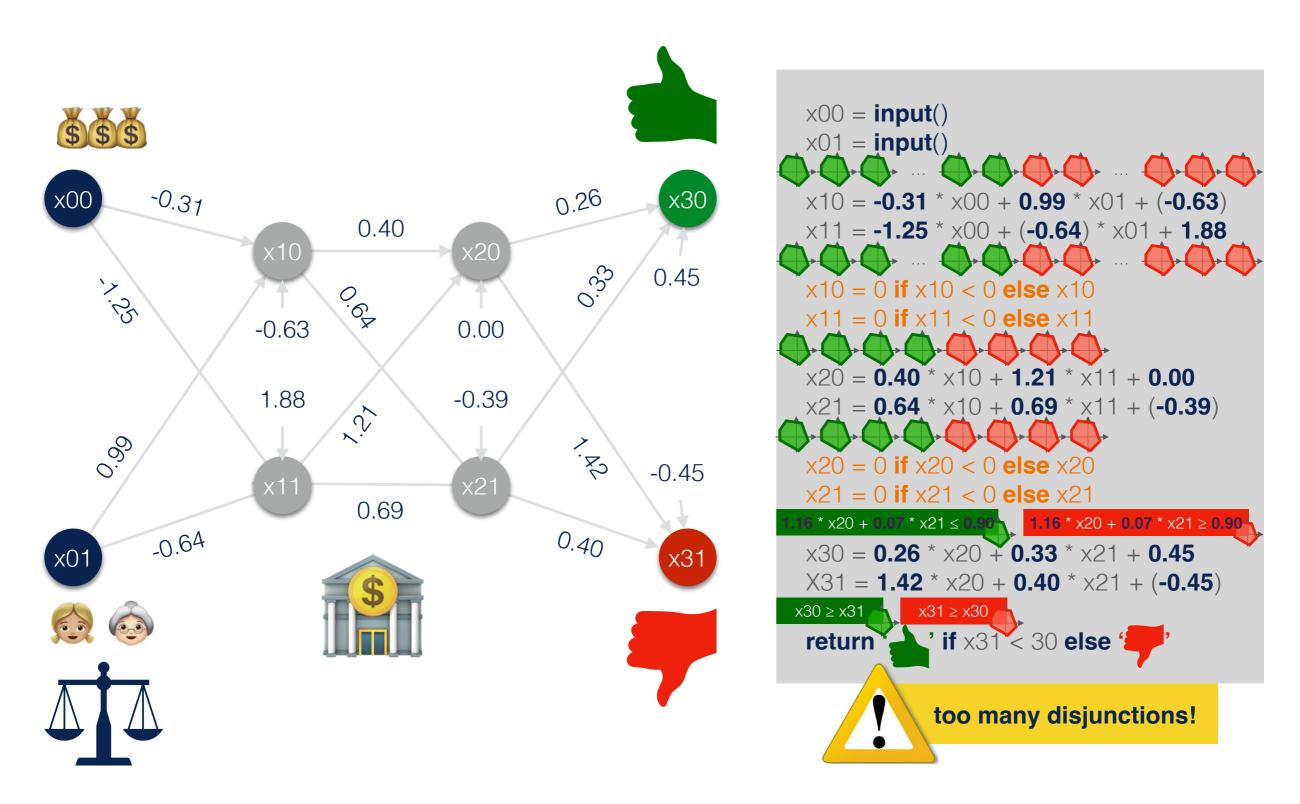

Naïve Backward Analysis

(2) forget the values of the sensitive input nodes

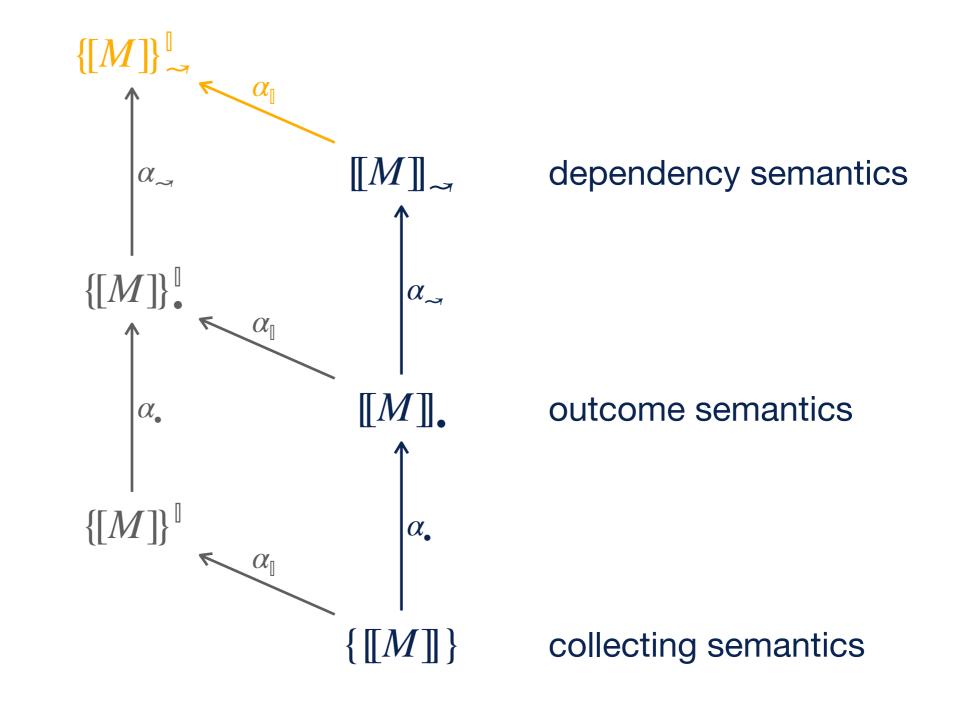

Naïve Backward Analysis

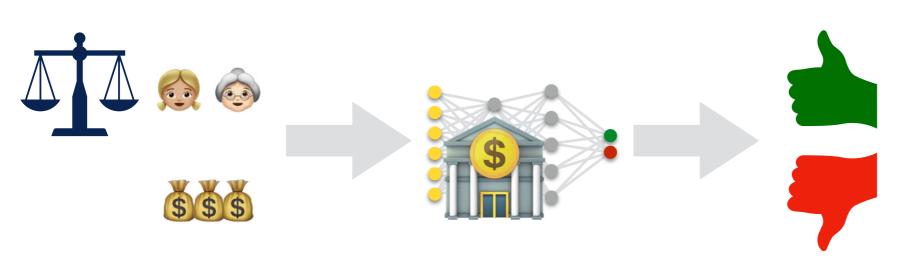

Back to the Semantics...

Hierarchy of Semantics

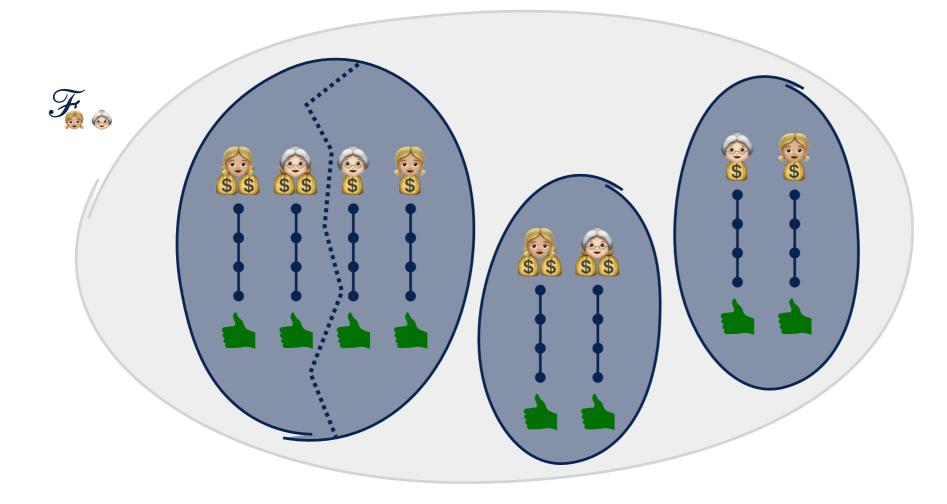

parallel semantics

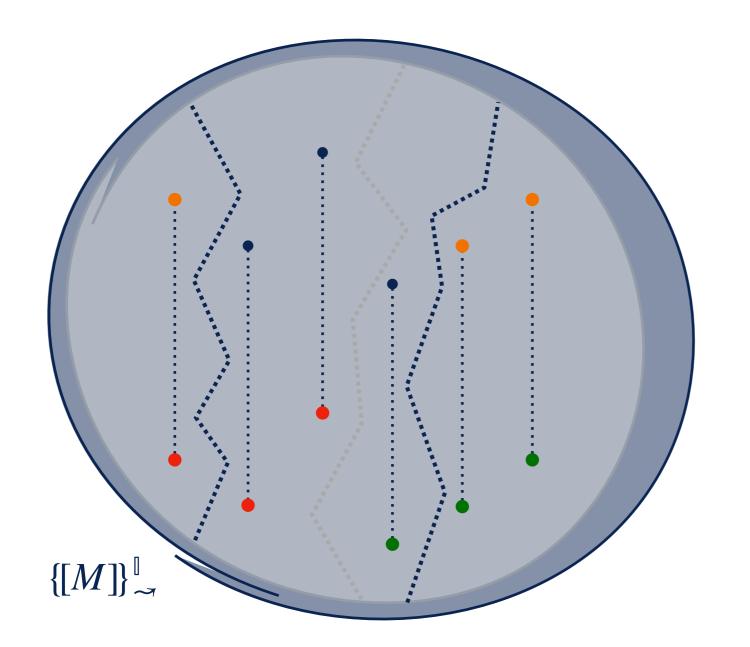

Parallel Semantics

partitioning a set of traces that satisfies dependency fairness with respect to the non-sensitive inputs yields sets of traces that also satisfy dependency fairness

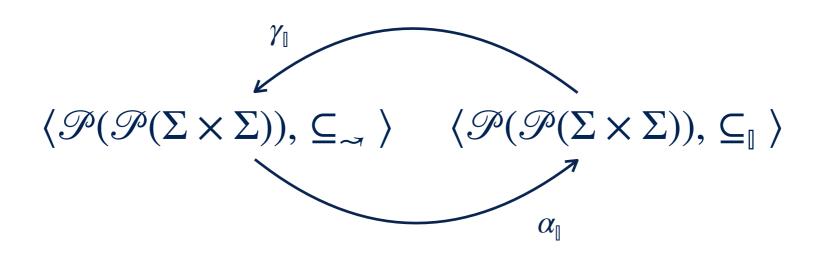

Parallel Semantics

partitioning a set of traces that satisfies dependency fairness with respect to the non-sensitive inputs yields sets of traces that also satisfy dependency fairness

Parallel Semantics

 $\alpha_{\mathbb{I}}(S) \stackrel{\text{def}}{=} \{ \{ \langle t_0, t_\omega \rangle \in R \mid t_0 \in I \} \mid R \in S \land I \in \mathbb{I} \}$

parallel abstraction

$\{ [M] \}_{\sim}^{\mathbb{I}} \stackrel{\text{def}}{=} \alpha_{\mathbb{I}}(\llbracket M \rrbracket_{\sim})$ = $\{ \{ \langle t_0, t_{\omega} \rangle \in \Sigma \times \Sigma \mid t \in \llbracket M \rrbracket \land t_0 \in I \land t_{\omega} \in O \} \mid I \in \mathbb{I} \land O \in \mathbb{O} \}$

Theorem

$$M \models \mathscr{F}_i \Leftrightarrow \gamma_{\prec}(\{[M]\}_{\prec}^{\mathbb{I}}) \subseteq \mathscr{F}_i$$

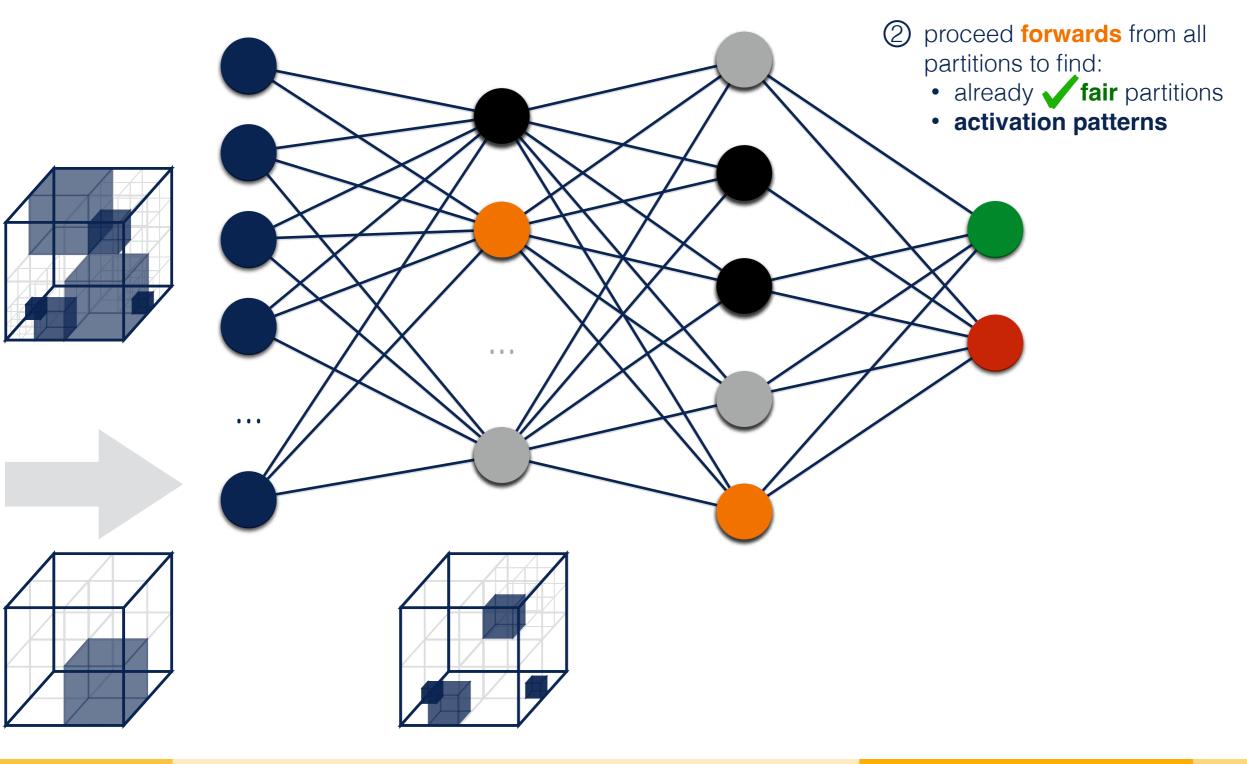

Lemma

 $M \models \mathcal{F}_i \Leftrightarrow \forall I \in \mathbb{I} \colon \forall A, B \in \{[M]\}_{\sim}^{\mathbb{I}} \colon (A_{\omega}^I \neq B_{\omega}^I \Rightarrow A_0^I|_{\neq i} \cap B_0^I|_{\neq i} = \emptyset)$

Better Abstraction

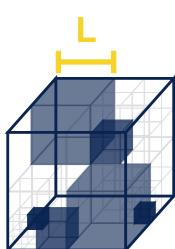

Forward and Backward Analysis

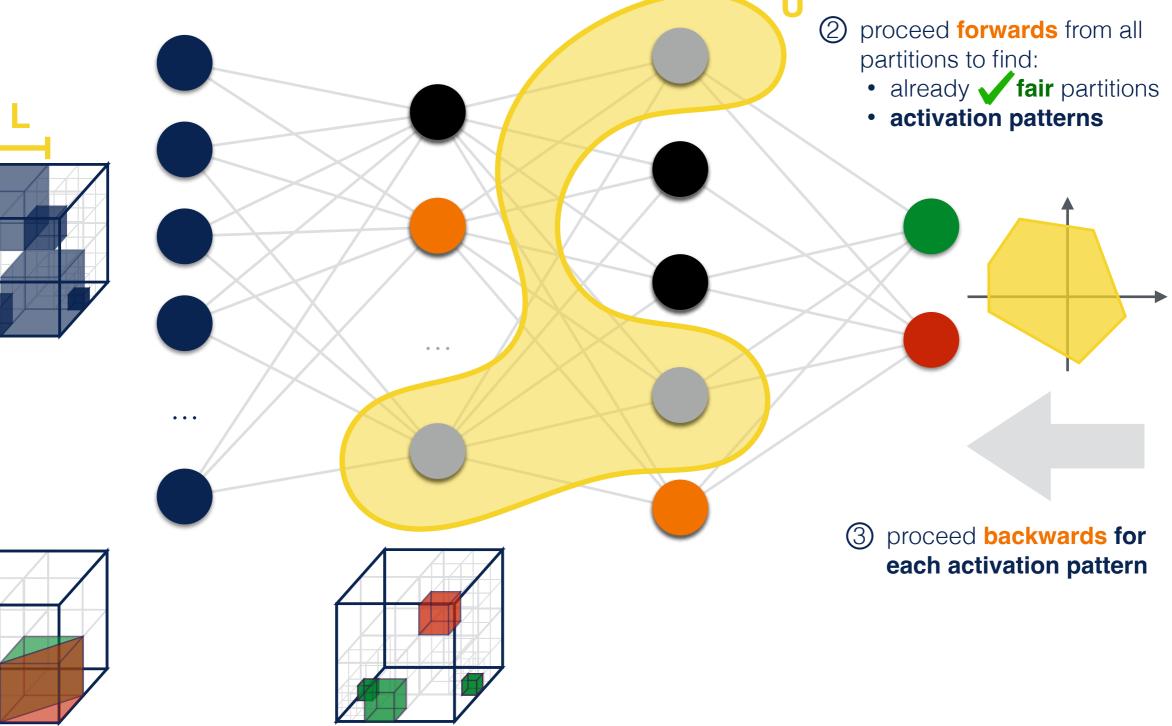

1 partition the space of values of the **non-sensitive input** nodes

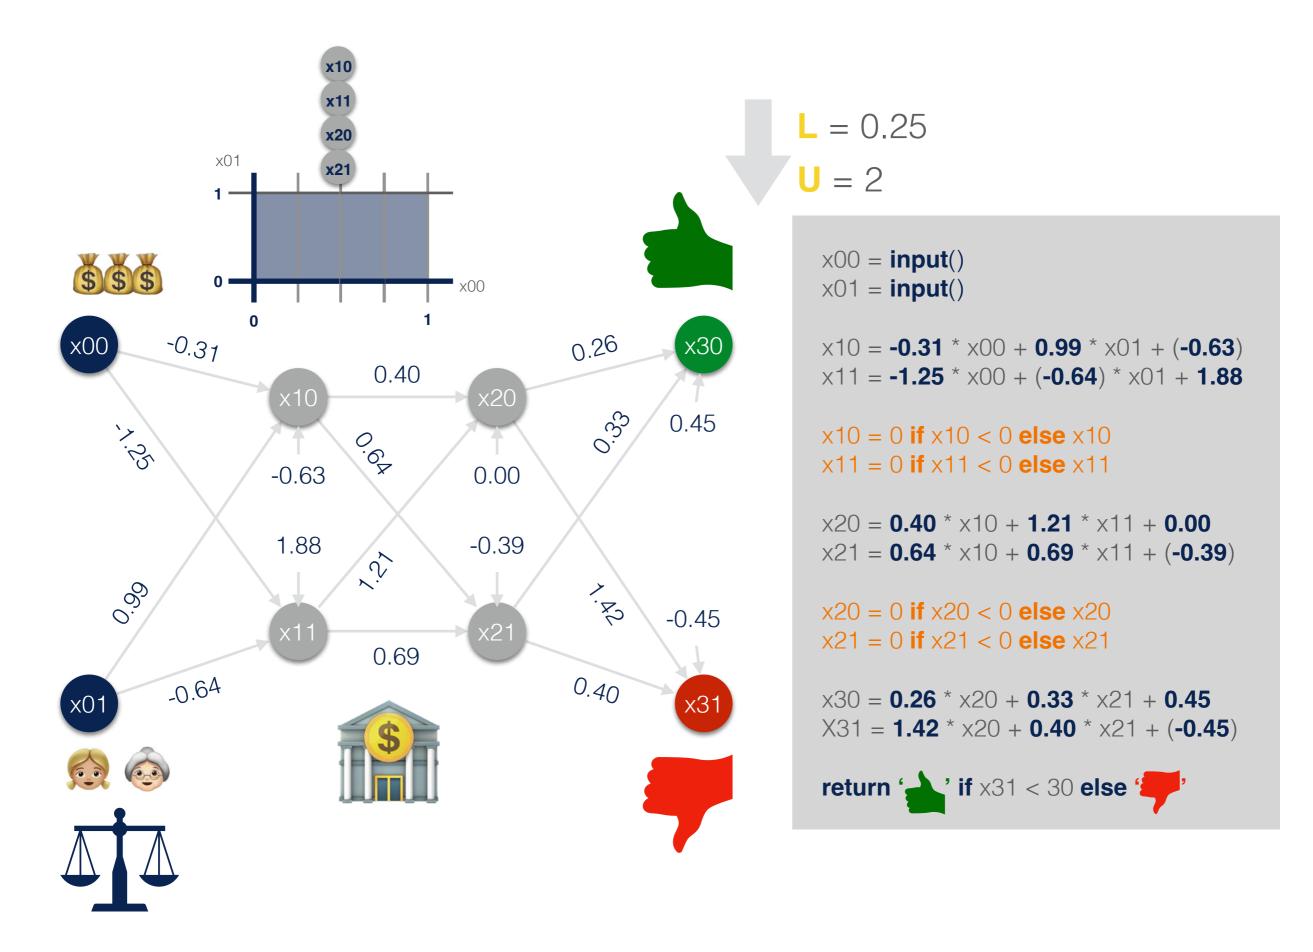

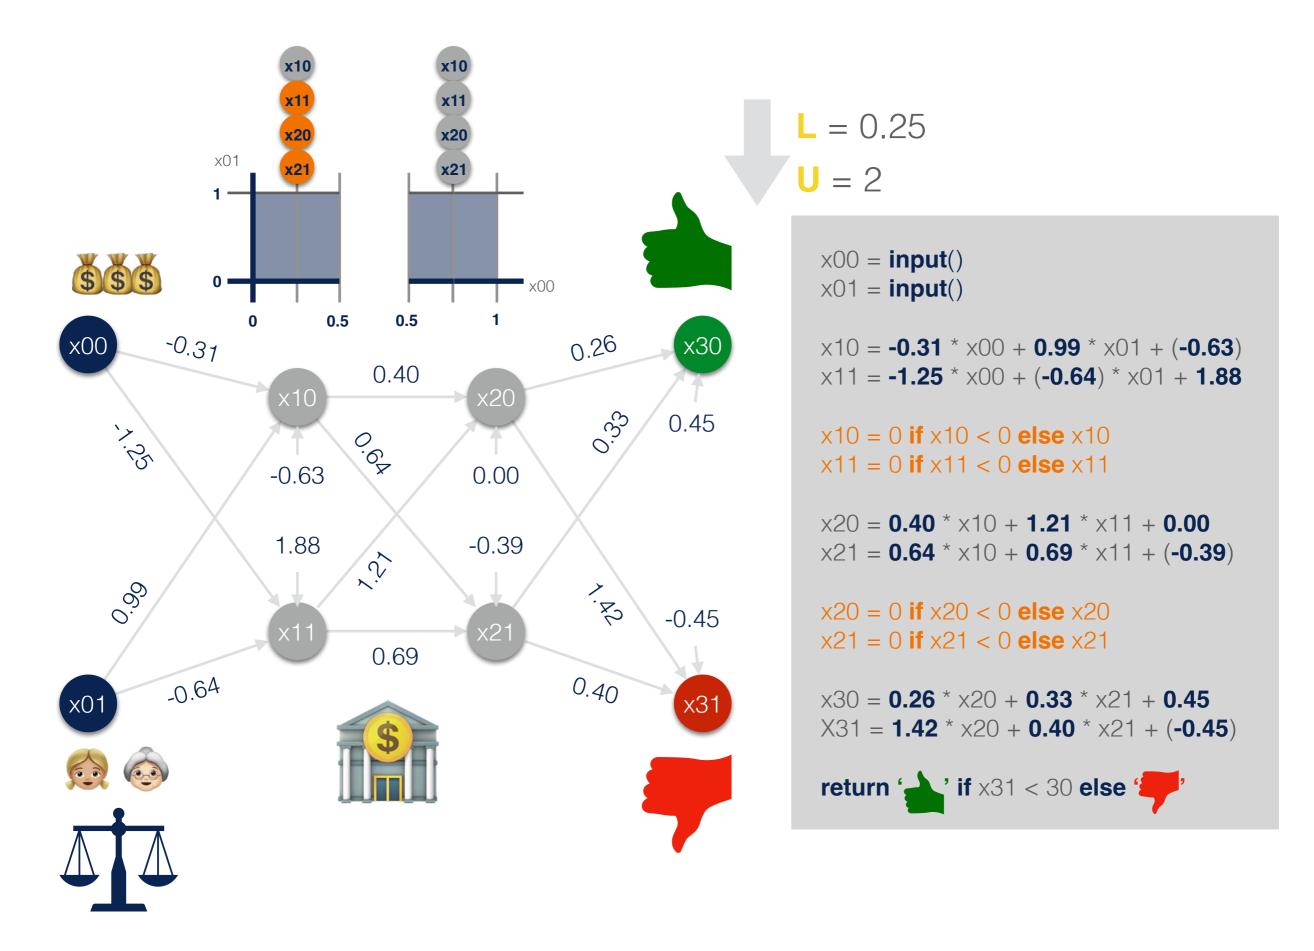

Forward and Backward Analysis

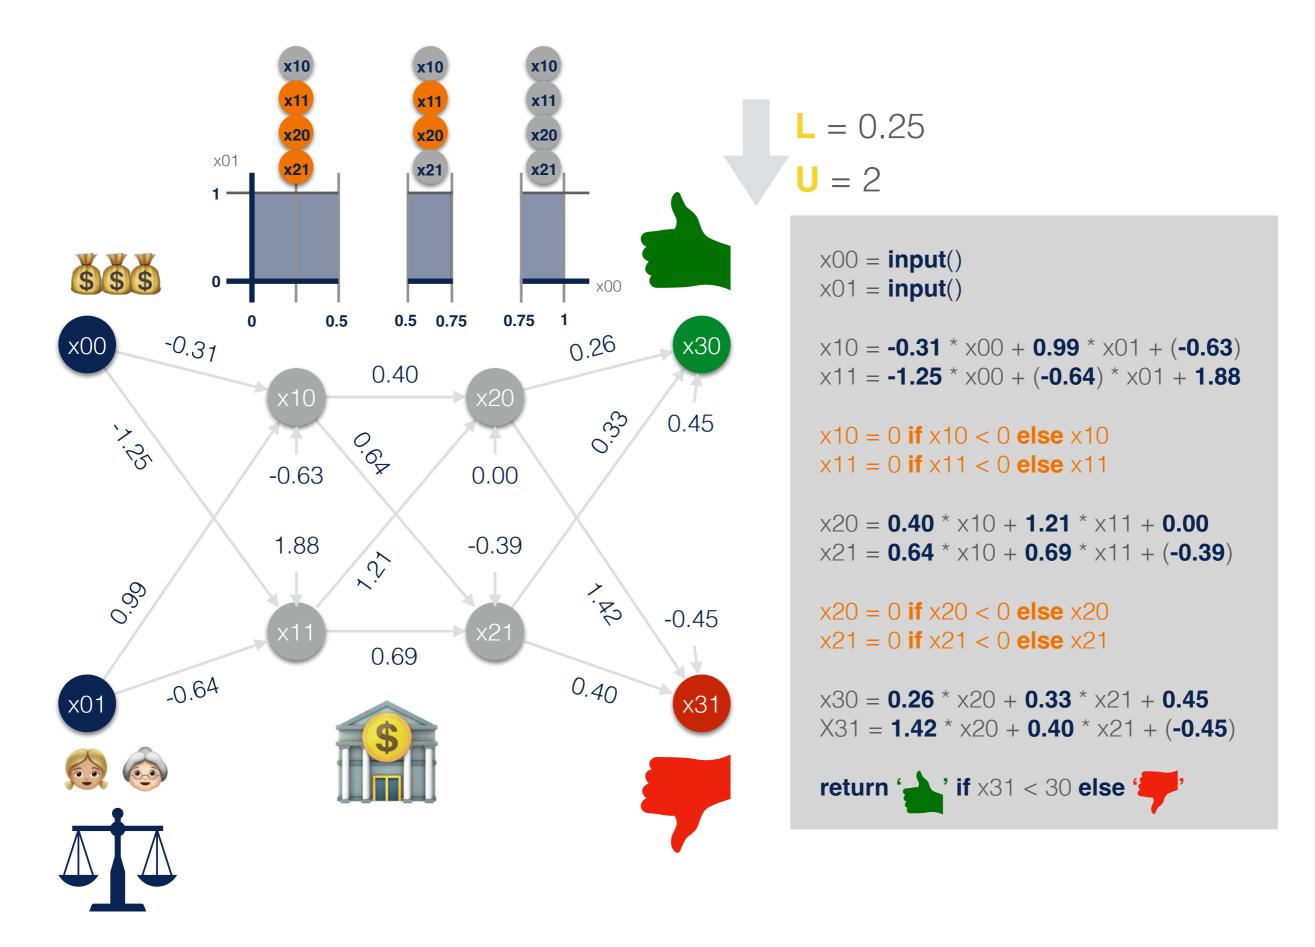

1 partition the space of values of the **non-sensitive input** nodes
