3 Garbled Circuits

Multi-Party Computation

n players P_i want to jointly evaluate $y_i = f_i(x_1, \dots, x_n)$, for public functions f_i so that

- x_i is the private input of P_i
- P_i eventually learns $y_i = f_i(x_1, \dots, x_n)$
- ... and nothing else about x_j for $j \neq i$

Security Notions

- Privacy
- Correctness
- Fairness (much harder to get)

t-Privacy

If *t* parties collude, they cannot learn more on the other inputs than from their own/known inputs and outputs

Note that the knowledge of y_i can leak some information on the x_j 's.

Security Models

- **Honest-but-curious:** all the players follow the protocol honestly, but the adversary knows all the inputs/outputs from *t* users
- **Malicious users:** the adversary controls a fixed set of *t* players
- **Dynamic adversary:** the adversary dynamically chooses the (up to) *t* players it controls

- Examples
- Malicious Setting

2 Oblivious Transfer

3 Garbled Circuits

Electronic Voting

Electronic Voting

Private Evaluation of the Sum

For all *i*: $x_i \in \{0, 1\}$ and $f_i(x_1, \dots, x_n) = \sum_j x_j$

Example (Homomorphic Encryption)

- P_i encrypts $C_i = E(x_i)$ with an additively homomorphic encryption scheme
- They all compute $C = E(\sum x_i)$
- They jointly decrypt C to get $y = \sum x_i$ using a distributed decryption

Privacy: Limitations

In case of unanimity (i.e. $\sum x_i = n$), one learns all the x_i 's, even in the honest-but-curious setting

This is not a weakness of the protocol, but of the functionality: one should just reveal the winner

Replay Attacks

A malicious adversary could try to amplify P_1 's vote, replaying its message C_1 by *t* corrupted players: this can leak P_1 's vote x_1

This can be avoided with non-malleable encryption

The 2-party particular case: on Alice's input x and Bob's input y , Alice gets $f(x, y)$ and Bob gets $g(x, y)$, but nothing else

Equality Test

Alice owns a value x and Bob owns a value y , in the end, they both learn whether $x = y$ or not

Yao Millionaires' Problem

Alice owns an integer x and Bob owns an integer y , in the end, they both learn whether $x \leq y$ or not

Alice owns a value $x \in [A, B]$ and Bob owns a value $y \in [A, B]$, in the end, they both learn whether $x = y$ or not

With Homomorphic Encryption

- Alice encrypts $C = E(x)$ with an additively homomorphic encryption scheme
- Bob computes $C' = E(r(x - y))$, for a random element r
- Alice computes $C'' = E(rr'(x - y))$, for a random element r'
- They jointly decrypt C'' : the value is 0 iff $x = y$ (or random)

Yao Millionaires' Problem

Alice owns an integer $x \in [0, 2^n[$ and Bob owns an integer $y \in [0, 2^n[$, in the end, they both learn whether $x \leq y$ or not

Theorem [Lin-Tzeng - 2005]

Given $x = x_{n-1} \dots x_0, y = y_{n-1} \dots y_0 \in \{0, 1\}^n$, and denoting

$$T_x^1 = \{x_{n-1} \dots x_i | x_i = 1\} \quad T_y^0 = \{y_{n-1} \dots y_{i+1} | y_i = 0\}$$

$$x > y \iff T_x^1 \cap T_y^0 \neq \emptyset$$

$$\begin{aligned} x > y &\iff \exists! i < n, (x_i > y_i) \wedge (\forall j > i, x_j = y_j) \\ &\iff \exists! i < n, (x_i = 1) \wedge (y_i = 0) \wedge (\forall j > i, x_j = y_j) \\ &\iff \exists! i < n, (y_i = 0) \wedge (x_{n-1} \dots x_i = y_{n-1} \dots y_{i+1} 1) \\ &\iff |T_x^1 \cap T_y^0| = 1 \end{aligned}$$

Yao Millionaires' Problem

We fill and order the sets by length: $\bar{T}_x^1 = \{X_i\}$ and $\bar{T}_y^0 = \{Y_i\}$ where for $i = 0, \dots, n$:

- if $x_i = 0, X_i = 2^n$, otherwise $X_i = x_{n-1} \dots x_i \in [0, 2^{n-i}[$
 - if $y_i = 1, Y_i = 2^n + 1$, otherwise $Y_i = y_{n-1} \dots y_{i+1} 1 \in [0, 2^{n-i}[$
- $$x > y \iff \exists! i < n, X_i = Y_i$$

With Homomorphic Encryption

- Alice encrypts $C_i = E(X_i)$ with an additively homomorphic encryption scheme
- Bob computes $C'_i = E(r_i(X_i - Y_i))$, for random elements r_i and sends them in random order
- Alice computes $C''_i = E(r'_i r_i(X_i - Y_i))$, for random elements r'_i
- They jointly decrypt the C''_i 's: one value is 0 iff $x > y$

3 Garbled Circuits

GMW Compiler

[Goldreich-Micali-Wigderson – STOC 1987]

- Commitment of the inputs
- Secure coin tossing
- Zero-knowledge proofs of correct behavior

1 Secure Function Evaluation

2 Oblivious Transfer

- Definition
- Examples

3 Garbled Circuits

Oblivious Transfer

[Rabin – 1981]

Alice owns two values x_0, x_1 and Bob owns a bit $b \in \{0, 1\}$, so that in the end, Bob learns x_b and Alice gets nothing: $x = (x_0, x_1)$ and $y = b$, then $f((x_0, x_1), b) = x_b$ and $g((x_0, x_1), b) = \perp$

[Kilian – STOC 1988]

Oblivious Transfer is equivalent to **Secure 2-Party Computation**

From an Oblivious Transfer Protocol,
one can implement any 2-Party Secure Function Evaluation

1 Secure Function Evaluation

2 Oblivious Transfer

- Definition
- Examples

3 Garbled Circuits

Example (Bellare-Micali's Construction – 1992)

In a discrete logarithm setting (\mathbb{G}, g, p) , for $x_0, x_1 \in \mathbb{G}$

- Alice chooses $c \xleftarrow{R} \mathbb{G}$ and sends it to Bob
- Bob chooses $k \xleftarrow{R} \mathbb{Z}_p$, sets $pk_b \leftarrow g^k$ and $pk_{1-b} \leftarrow c/pk_b$, and sends (pk_0, pk_1) to Alice
- Alice checks $pk_0 \cdot pk_1 = c$ and encrypts x_i under pk_i (for $i = 0, 1$) with ElGamal: $C_i \leftarrow g^{r_i}$ and $C'_i \leftarrow x_i \cdot pk_i^{r_i}$, for $r_i \xleftarrow{R} \mathbb{Z}_p$
- Bob can decrypt (C_b, C'_b) using k

Because of the random c (unknown discrete logarithm),
 Bob should not be able to infer any information about x_{1-b}
 This is provably secure in the **honest-but-curious setting**

Oblivious Transfer

Outline

Example (Naor-Pinkas Construction – 2000)

In a discrete logarithm setting (\mathbb{G}, g, p) , for $x_0, x_1 \in \mathbb{G}$

- Bob chooses $r, s, t \xleftarrow{R} \mathbb{Z}_p$, sets $X \leftarrow g^r, Y \leftarrow g^s, Z_b \leftarrow g^{rs}, Z_{1-b} \leftarrow g^t$, and sends (X, Y, Z_0, Z_1) to Bob
- Alice checks $Z_0 \neq Z_1$, and re-randomizes the tuples:
 $T_0 \leftarrow (X, Y'_0 = Y^{u_0} g^{v_0}, Z'_0 = Z_0^{u_0} X^{v_0})$ and
 $T_1 \leftarrow (X, Y'_1 = Y^{u_1} g^{v_1}, Z'_1 = Z_1^{u_1} X^{v_1})$, for $u_0, v_0, u_1, v_1 \xleftarrow{R} \mathbb{Z}_p$
- Alice encrypts x_i under T_i : $C_i = Y'_i$ and $C'_i = x_i \cdot Z'_i$
- Bob can decrypt (C_b, C'_b) using r

The re-randomization keeps the DH-tuple T_b ,
 but perfectly removes information in T_{1-b}
 This is provably secure in the **malicious setting**

1 Secure Function Evaluation

2 Oblivious Transfer

3 Garbled Circuits

- Introduction
- Garbled Circuits
- Correctness

Boolean circuit, Alice's inputs (x_1, x_2, x_3) , and Bob's inputs (y_1, y_2, y_3) :

They both learn z in the end, but nothing else

- 1 Secure Function Evaluation
- 2 Oblivious Transfer
- 3 Garbled Circuits
 - Introduction
 - Garbled Circuits
 - Correctness

Garbled Circuit

Garbled Gates

Alice converts the circuit into a generic circuit: 1-input or 2-input gates

Alice generates the garbled gates

1-Input Garbled Gate

For the gate A (not): 4 random secret keys $I_A^0, I_A^1, O_A^0, O_A^1$
 $A = \begin{bmatrix} 1 & 0 \end{bmatrix}$: $C_A^0 = \text{Encrypt}(I_A^0, O_A^1)$ $C_A^1 = \text{Encrypt}(I_A^1, O_A^0)$

2-Input Garbled Gate

For the gate B (and): 8 random secret keys $I_B^0, I_B^1, J_B^0, J_B^1, O_B^0, O_B^1$
 $B = \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix}$: $C_B^{00} = \text{Encrypt}(I_B^0 || J_B^0, O_B^0)$ $C_B^{01} = \text{Encrypt}(I_B^0 || J_B^1, O_B^0)$
 $C_B^{10} = \text{Encrypt}(I_B^1 || J_B^0, O_B^0)$ $C_B^{11} = \text{Encrypt}(I_B^1 || J_B^1, O_B^1)$

Alice's Inputs

Alice publishes the ciphertexts in random order for each gate

Alice publishes the keys corresponding to her inputs:

- for x_1 , she sends $I_D^{x_1}$
- for x_2 , she sends $J_B^{x_2}$
- for x_3 , she sends $J_C^{x_3}$

Bob's Inputs

$$A = [1 \ 0]: C_A^0 = \text{Encrypt}(I_A^0, O_A^1) \quad C_A^1 = \text{Encrypt}(I_A^1, O_A^0)$$

Oblivious Transfer

Alice owns I_A^0, I_A^1 and Bob owns $y_1 \in \{0, 1\}$

- Using an OT, Bob gets $I_A^{y_1}$, while Alice learns nothing
- From the ciphertexts $(C_A^b)_b$, Bob gets $O_A^{y_A}$

Bob's Inputs

$$B = \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix}: C_B^{00} = \text{Encrypt}(I_B^0 || J_B^0, O_B^0) \quad C_B^{01} = \text{Encrypt}(I_B^0 || J_B^1, O_B^0) \\ C_B^{10} = \text{Encrypt}(I_B^1 || J_B^0, O_B^0) \quad C_B^{11} = \text{Encrypt}(I_B^1 || J_B^1, O_B^0)$$

Internal Garbled Gates

Oblivious Transfer

Alice owns I_B^0, I_B^1 , and Bob owns $y_2 \in \{0, 1\}$

- Using an OT, Bob gets $I_B^{y_2}$, while Alice learns nothing
- Bob additionally knows $J_B^{x_2}$
- From the ciphertexts $(C_B^{bb'})_{bb'}$, Bob gets $O_B^{y_B}$

Internal Garbled Gate

For the gate E (or): 2 new random secret keys O_E^0, O_E^1 while $I_E^0 \leftarrow O_A^0, I_E^1 \leftarrow O_A^1, J_E^0 \leftarrow O_B^0, J_E^1 \leftarrow O_B^1$

$$E = \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix}: C_E^{00} = \text{Encrypt}(I_E^0 || J_E^0, O_E^0) \quad C_E^{01} = \text{Encrypt}(I_E^0 || J_E^1, O_E^1) \\ C_E^{10} = \text{Encrypt}(I_E^1 || J_E^0, O_E^1) \quad C_E^{11} = \text{Encrypt}(I_E^1 || J_E^1, O_E^1)$$

Evaluation of Internal Gates

$$E = \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix} : C_E^{00} = \text{Encrypt}(I_E^0 || J_E^0, O_E^0) \quad C_E^{01} = \text{Encrypt}(I_E^0 || J_E^1, O_E^1) \\ C_E^{10} = \text{Encrypt}(I_E^1 || J_E^0, O_E^1) \quad C_E^{11} = \text{Encrypt}(I_E^1 || J_E^1, O_E^1)$$

Evaluation of Gate E

Bob knows $I_E^{y_A} = O_A^{y_A}$ and $J_E^{y_B} = O_B^{y_B}$
 From the ciphertexts $(C_E^{bb'})_{bb'}$, Bob gets $O_E^{y_E}$

Output Garbled Gates

Output Garbled Gate

For the gate G (or): $I_G^0 \leftarrow O_E^0, I_G^1 \leftarrow O_E^1, J_G^0 \leftarrow O_F^0, J_G^1 \leftarrow O_F^1$

$$G = \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix} : C_G^{00} = \text{Encrypt}(I_G^0 || J_G^0, 0) \quad C_G^{01} = \text{Encrypt}(I_G^0 || J_G^1, 1) \\ C_G^{10} = \text{Encrypt}(I_G^1 || J_G^0, 1) \quad C_G^{11} = \text{Encrypt}(I_G^1 || J_G^1, 1)$$

Evaluation of Internal Gates

$$G = \begin{bmatrix} 0 & 1 \\ 1 & 1 \end{bmatrix} : C_G^{00} = \text{Encrypt}(I_G^0 || J_G^0, 0) \quad C_G^{01} = \text{Encrypt}(I_G^0 || J_G^1, 1) \\ C_G^{10} = \text{Encrypt}(I_G^1 || J_G^0, 1) \quad C_G^{11} = \text{Encrypt}(I_G^1 || J_G^1, 1)$$

Evaluation of Gate G

Bob knows $I_G^{y_E} = O_E^{y_E}$ and $J_G^{y_F} = O_F^{y_F}$
 From the ciphertexts $(C_G^{bb'})_{bb'}$, Bob gets $z \in \{0, 1\}$
 Bob can then transmit z to Alice

Outline

- 1 Secure Function Evaluation
- 2 Oblivious Transfer
- 3 Garbled Circuits
 - Introduction
 - Garbled Circuits
 - Correctness

The previous construction assumes that

- Bob extracts the correct plaintext among the multiple candidates
⇒ Redundancy is added to the plaintext
(or authenticated encryption)

They have to trust each other

- Alice correctly builds garbled gates: the ciphertexts are correct
⇒ Cut-and-choose technique
- Alice plays the oblivious transfer protocols with correct inputs
⇒ Inputs are committed, checked during the cut-and-choose, and ZK proofs are done during the OT
- Bob sends back the correct value z
⇒ Random tags are appended to the final results 0 and 1 that Bob cannot guess
